

# **Application Note**

## **AN\_324**

# **FT900 User Manual**

**Version 1.3**

**Issue Date: 29-08-2023**

This document provides details about the peripherals of the FT900 as well as the general system registers.

Use of Bridgetek devices in life support and/or safety applications is entirely at the user's risk, and the user agrees to defend, indemnify and hold Bridgetek harmless from any and all damages, claims, suits or expense resulting from such use.

## **Table of Contents**

<b>1 Introduction.....</b>	<b>14</b>
<b>2 FT900 System Architecture .....</b>	<b>15</b>
<b>2.1 Architecture Overview .....</b>	<b>15</b>
<b>2.2 Memory Organization .....</b>	<b>16</b>
<b>2.3 FT900 Boot Control .....</b>	<b>16</b>
<b>2.4 Debugging Support .....</b>	<b>17</b>
<b>3 Register Map.....</b>	<b>18</b>
<b>4 Notations .....</b>	<b>19</b>
<b>5 General System Registers .....</b>	<b>20</b>
<b>5.1 Register Summary.....</b>	<b>20</b>
<b>5.2 Register Details.....</b>	<b>22</b>
5.2.1 CHIPID - Chip ID Register (address offset: 0x00).....	22
5.2.2 EFCFG - Chip Configuration Register (address offset: 0x04) .....	22
5.2.3 CLKCFG - Clock Configuration Register (address offset: 0x08) .....	23
5.2.4 PMCFG - Power Management Register (address offset: 0x0C) .....	24
5.2.5 PTSTNSET - Test & Set Register (address offset: 0x10) .....	25
5.2.6 PTSTNSETR - Test & Set Shadow Register (address offset: 0x14) .....	25
5.2.7 MSC0CFG - Miscellaneous Configuration Register (address offset: 0x18).....	26
5.2.8 GPIO Pin Configuration Registers (address offset: 0x1C – 0x5F) .....	28
5.2.9 GPIO Configuration Registers (address offset: 0x60 – 0x83) .....	32
5.2.10 GPIO Value Registers (address offset: 0x84 – 0x8F).....	35
5.2.11 GPIO Interrupt Enable Registers (address offset: 0x90 – 0x9B) .....	35
5.2.12 Interrupt Pending Registers (address offset: 0x9C – 0xA7).....	36
5.2.13 ETH_PHY_CFG - Ethernet PHY Miscellaneous Configuration Register (address offset: 0xA8) .....	36
5.2.14 ETH_PHY_ID - Ethernet PHY ID Register (address offset: 0xAC).....	37
5.2.15 DAC_ADC_CONF - ADC/DAC Configuration/Status Register (address offset: 0xB0) ...	37
5.2.16 DAC_ADC_CNT - ADC/DAC Count Register (address offset: 0xB4).....	38
5.2.17 DAC_ADC_DATA - ADC/DAC Data Register (address offset: 0xB8) .....	39
<b>6 Interrupt Controller .....</b>	<b>40</b>
<b>6.1 Register Summary.....</b>	<b>40</b>

---

**6.2 Register Details.....41**

6.2.1 IRQ00-03 Assignment Register (address offset: 0x00).....	41
6.2.2 IRQ04-07 Assignment Register (address offset: 0x04).....	41
6.2.3 IRQ08-11 Assignment Register (address offset: 0x08).....	41
6.2.4 IRQ12-15 Assignment Register (address offset: 0x0C) .....	42
6.2.5 IRQ16-19 Assignment Register (address offset: 0x10).....	42
6.2.6 IRQ20-23 Assignment Register (address offset: 0x14).....	42
6.2.7 IRQ24-27 Assignment Register (address offset: 0x18).....	42
6.2.8 IRQ28-31 Assignment Register (address offset: 0x1C) .....	43
6.2.9 IRQ Control Register (address offset: 0x20) .....	43

**7 EFUSE .....44**

<b>7.1 Introduction.....44</b>
<b>7.2 EFUSE Operation .....44</b>
<b>7.3 EFUSE bits.....44</b>

**8 USB Host.....46**

<b>8.1 Register Summary.....46</b>
<b>8.2 EHCI Operational Registers.....47</b>

8.2.1 HC Capability Register (address offset: 0x00).....	47
8.2.2 HCSPARAMS – HC Structural Parameters (address offset: 0x04).....	47
8.2.3 HCCPARAMS – HC Capability Parameters (address offset: 0x08).....	47
8.2.4 USBCMD – HC USB Command Register (address offset: 0x10) .....	48
8.2.5 USBSTS – HC USB Status Register (address offset: 0x14).....	49
8.2.6 USBINTR – HC USB Interrupt Enable Register (address offset: 0x18) .....	50
8.2.7 FRINDEX – HC Frame Index Register (address offset: 0x1C) .....	51
8.2.8 PERIODICLISTBASE – HC Periodic Frame List Base Address Register (address offset: 0x24) .....	51
8.2.9 ASYNCLISTADDR – HC Current Asynchronous List Address Register (address offset: 0x28) .....	51
8.2.10 PORTSC – HC Port Status and Control Register (address offset: 0x30).....	52

**8.3 Configuration Registers .....53**

8.3.1 EOF Time & Asynchronous Schedule Sleep Timer Register (address offset: 0x34) .....	53
8.3.2 Bus Monitor Control / Status Register (address offset: 0x40).....	55
8.3.3 HPROT – Master Protection Information Setting Register (address offset: 0x78) .....	55

**8.4 USB Host Testing Registers .....56**

8.4.1 Vendor Specific IO Control Register (address offset: 0x54) .....	56
8.4.2 Vendor Specific Status Register (address offset: 0x58) .....	56
8.4.3 Test Register (address offset: 0x50).....	56
8.4.4 HC_RSRV1 - Reserved 1 Register (address offset: 0x70) .....	57
8.4.5 HC_RSRV2 - Reserved 2 Register (address offset: 0x74) .....	57
<b>9 USB Peripheral.....</b>	<b>58</b>
<b>9.1 Register Summary.....</b>	<b>58</b>
<b>9.2 Initialization Registers.....</b>	<b>60</b>
9.2.1 DC_ADDRESS_ENABLE – Address Register (address offset: 0x18) .....	60
9.2.2 DC_MODE – Mode Register (address offset: 0x10) .....	60
9.2.3 DC_INT_ENABLE – Interrupt Enable Register (address offset: 0x08) .....	61
9.2.4 DC_EP_INT_ENABLE – Endpoints Interrupt Enable Register (address offset: 0x0C) ....	61
<b>9.3 Control Endpoint Data Flow Registers .....</b>	<b>61</b>
9.3.1 DC_EP0_CONTROL – Endpoint 0 Control Register (address offset: 0x1C) .....	61
9.3.2 DC_EP0_STATUS – Endpoint 0 Status Register (address offset: 0x20) .....	62
9.3.3 DC_EP0_BUFFER_LENGTH – Endpoint 0 Buffer Length Register (address offset: 0x24)	62
9.3.4 DC_EP0_BUFFER – Endpoint 0 Buffer Register (address offset: 0x28).....	63
<b>9.4 Other Endpoint Data Flow Registers.....</b>	<b>63</b>
9.4.1 DC_EP(x)_CONTROL – Endpoint Control Registers (address offset: 0x2C/0x3C/0x4C/0x5C/0x6C/0x7C/0x8C) .....	63
9.4.2 DC_EP(x)_STATUS – Endpoint Status Registers (address offset: 0x30/0x40/0x50/0x60/0x70/0x80/0x90) .....	64
9.4.3 DC_EP(x)_BUFFER_LENGTH_LSB – Endpoint Buffer Length LSB Registers (address offset: 0x34/0x44/0x54/0x64/0x74/0x84/0x94) .....	65
9.4.4 DC_EP(x)_BUFFER_LENGTH_MSB – Endpoint Buffer Length MSB Registers (address offset: 0x35/0x45/0x55/0x65/0x75/0x85/0x95) .....	65
9.4.5 DC_EP(x)_BUFFER – Endpoint Buffer Registers (address offset: 0x38/0x48/0x58/0x68/0x78/0x88/0x98) .....	65
<b>9.5 General Registers.....</b>	<b>66</b>
9.5.1 DC_INT_STATUS – Interrupt Status Register (address offset: 0x00) .....	66
9.5.2 DC_EP_INT_STATUS – Endpoints Interrupt Status Register (address offset: 0x04)....	66
9.5.3 DC_FRAME_NUMBER_LSB – Frame Number LSB Register (address offset: 0x14) .....	66
9.5.4 DC_FRAME_NUMBER_MSB – Frame Number MSB Register (address offset: 0x15).....	66
<b>10 Ethernet.....</b>	<b>67</b>
<b>10.1 Register Summary.....</b>	<b>67</b>

## 10.2 Register Details.....**68**

10.2.1 ETH_INT_STATUS – Interrupt Status Register (address offset: 0x0) .....	68
10.2.2 ETH_INT_ENABLE – Interrupt Enable Register (address offset: 0x1).....	69
10.2.3 ETH_RX_CNTL – Receive Control Register (address offset: 0x02) .....	70
10.2.4 ETH_TX_CNTL – Transmit Control Register (address offset: 0x03).....	70
10.2.5 ETH_DATA_N0 – Data Register (octet n) (address offset: 0x04).....	71
10.2.6 ETH_DATA_N1 – Data Register (octet n+1) (address offset: 0x05).....	71
10.2.7 ETH_DATA_N2 – Data Register (octet n+2) (address offset: 0x06).....	71
10.2.8 ETH_DATA_N3 – Data Register (octet n+3) (address offset: 0x07).....	71
10.2.9 ETH_ADDR_1 – Address Register (octet 1) (address offset: 0x08).....	71
10.2.10 ETH_ADDR_2 – Address Register (octet 2) (address offset: 0x09).....	71
10.2.11 ETH_ADDR_3 – Address Register (octet 3) (address offset: 0x0A).....	72
10.2.12 ETH_ADDR_4 – Address Register (octet 4) (address offset: 0x0B).....	72
10.2.13 ETH_ADDR_5 – Address Register (octet 5) (address offset: 0x0C).....	72
10.2.14 ETH_ADDR_6 – Address Register (octet 6) (address offset: 0x0D).....	72
10.2.15 ETH_THRESHOLD – Threshold Register (address offset: 0x0E) .....	72
10.2.16 ETH_MNG_CNTL – Management Control Register (address offset: 0x0F) .....	72
10.2.17 ETH_MNG_DIV – Management Divider Register (address offset: 0x10) .....	73
10.2.18 ETH_MNG_ADDR – Management Address Register (address offset: 0x11) .....	73
10.2.19 ETH_MNG_TX0 – Management Transmit Data 0 Register (address offset: 0x12)....	73
10.2.20 ETH_MNG_TX1 – Management Transmit Data 1 Register (address offset: 0x13)....	73
10.2.21 ETH_MNG_RX0 – Management Receive Data 0 Register (address offset: 0x14).....	74
10.2.22 ETH_MNG_RX1 – Management Receive Data 1 Register (address offset: 0x15).....	74
10.2.23 ETH_NUM_PKT – Number of Packets Register (address offset: 0x16) .....	74
10.2.24 ETH_TR_REQ – Transmission Request Register (address offset: 0x17) .....	74

## 11 CAN Bus Controller.....**75**

### 11.1 Register Summary.....**77**

### 11.2 Register Details.....**78**

11.2.1 CAN_MODE – Mode Register (address offset: 0x00) .....	78
11.2.2 CAN_CMD – Command Register (address offset: 0x01).....	78
11.2.3 CAN_STATUS – Status Register (address offset: 0x02) .....	79
11.2.4 CAN_INT_STATUS – Interrupt Status Register (address offset: 0x03).....	80
11.2.5 CAN_INT_ENABLE – Interrupt Enable Register (address offset: 0x04).....	80
11.2.6 CAN_RX_MSG – Receive Message Register (address offset: 0x05).....	81
11.2.7 CAN_BUS_TIM_0 – Bus Timing 0 Register (address offset: 0x06).....	81

11.2.8 CAN_BUS_TIM_1 – Bus Timing 1 Register (address offset: 0x07).....	81
11.2.9 CAN_TX_BUF - Transmit Buffer Register .....	82
11.2.10 CAN_RX_BUF - Receive Buffer Register .....	83
11.2.11 CAN Acceptance Filter .....	84
11.2.12 CAN_ERR_CODE – Error Code Capture Register (address offset: 0x18) .....	87
11.2.13 CAN_RX_ERR_CNTR – Receive Error Counter Register (address offset: 0x19) .....	87
11.2.14 CAN_TX_ERR_CNTR – Transmit Error Counter Register (address offset: 0x1A).....	88
11.2.15 CAN_ARB_LOST_CODE – Arbitration Lost Code Capture Register (address offset: 0x1B) .....	88
<b>12 SD Host.....</b>	<b>89</b>
<b>12.1 Register Summary.....</b>	<b>89</b>
<b>12.2 Register Details.....</b>	<b>92</b>
12.2.1 SDH_AUTO_CMD23_ARG2 – Auto CMD23 Argument 2 Register (address offset: 0x00) .....	92
12.2.2 SDH_BLK_SIZE – Block Size Register (address offset: 0x04) .....	92
12.2.3 SDH_BLK_COUNT – Block Count Register (address offset: 0x06) .....	92
12.2.4 SDH_ARG_1 – Argument 1 Register (address offset: 0x08) .....	92
12.2.5 SDH_TNSFER_MODE – Transfer Mode Register (address offset: 0x0C).....	93
12.2.6 SDH_CMD – Command Register (address offset: 0x0E) .....	93
12.2.7 SDH_RESPONSE – Response Register (address offset: 0x10-0x1C) .....	94
12.2.8 SDH_BUF_DATA – Buffer Data Port Register (address offset: 0x20) .....	94
12.2.9 SDH_PRESENT_STATE – Present State Register (address offset: 0x24).....	95
12.2.10 SDH_HST_CNTL_1 – Host Control 1 Register (address offset: 0x28).....	97
12.2.11 SDH_PWR_CNTL – Power Control Register (address offset: 0x29) .....	97
12.2.12 SDH_BLK_GAP_CNTL – Block Gap Control Register (address offset: 0x2A) .....	97
12.2.13 SDH_CLK_CNTL – Clock Control Register (address offset: 0x2C) .....	98
12.2.14 SDH_TIMEOUT_CNTL – Timeout Control Register (address offset: 0x2E) .....	98
12.2.15 SDH_SW_RST – Software Reset Register (address offset: 0x2F) .....	98
12.2.16 SDH_NRML_INT_STATUS – Normal Interrupt Status Register (address offset: 0x30) .....	99
12.2.17 SDH_ERR_INT_STATUS – Error Interrupt Status Register (address offset: 0x32) ...	99
12.2.18 SDH_NRML_INT_ENABLE – Normal Interrupt Status Enable Register (address offset: 0x34) .....	100
12.2.19 SDH_ERR_INT_ENABLE – Error Interrupt Status Enable Register (address offset: 0x36) .....	101
12.2.20 SDH_NRML_INT_SGNL_ENABLE – Normal Interrupt Signal Enable Register (address offset: 0x38) .....	101

12.2.21 SDH_ERR_INT_SGNL_ENABLE – Error Interrupt Signal Enable Register (address offset: 0x3A) .....	102
12.2.22 SDH_AUTO_CMD12_ERR_STATUS – Auto CMD12 Error Status Register (address offset: 0x3C) .....	102
12.2.23 SDH_HOST_CNTL_2 – Host Control 2 Register (address offset: 0x3E).....	103
12.2.24 SDH_CAP_1 – Capabilities Register 1 (address offset: 0x40).....	103
12.2.25 SDH_CAP_2 – Capabilities Register 2 (address offset: 0x44).....	104
12.2.26 SDH_RSRV_1 – Reserved 1 Register (address offset: 0x48) .....	105
12.2.27 SDH_RSRV_2 – Reserved 2 Register (address offset: 0x4C) .....	105
12.2.28 SDH_FORCE_EVT_CMD_ERR_STATUS – Force Event Register for Auto CMD Error Status (address offset: 0x50) .....	105
12.2.29 SDH_FORCE_EVT_ERR_INT_STATUS – Force Event for Error Interrupt Status Register (address offset: 0x52) .....	106
12.2.30 SDH_RSRV_3 – Reserved 3 Register (address offset: 0x54) .....	106
12.2.31 SDH_RSRV_4 – Reserved 4 Register (address offset: 0x58) .....	106
12.2.32 SDH_PRST_INIT – Preset value for initialization (address offset: 0x60).....	106
12.2.33 SDH_PRST_DFLT_SPD – Preset value for default speed (address offset: 0x62) ....	107
12.2.34 SDH_PRST_HIGH_SPD – Preset value for the high speed (address offset: 0x64) ...	107
12.2.35 SDH_PRST_SDR12 – Preset value for SDR12 (address offset: 0x66).....	107
12.2.36 SDH_PRST_SDR25 – Preset value for SDR25 (address offset: 0x68).....	108
12.2.37 SDH_PRST_SDR50 – Preset value for SDR50 (address offset: 0x6A).....	108
12.2.38 SDH_PRST_SDR104 – Preset value for SDR104 (address offset: 0x6C) .....	109
12.2.39 SDH_PRST_DDR50 – Preset value for DDR50 (address offset: 0x6E) .....	109
12.2.40 SDH_RSRV_5 – Reserved 5 Register (address offset: 0xFC) .....	110
12.2.41 SDH_HC_VER – Host Controller Version Register (address offset: 0xFE).....	110
12.2.42 SDH_VNDR_0 – Vendor-defined 0 Register (address offset: 0x100).....	110
12.2.43 SDH_VNDR_1 – Vendor-defined 1 Register (address offset: 0x104).....	111
12.2.44 SDH_VNDR_2 – Vendor-defined 2 Register (address offset: 0x108).....	111
12.2.45 SDH_VNDR_3 – Vendor-defined 3 Register (address offset: 0x10C).....	111
12.2.46 SDH_VNDR_4 – Vendor-defined 4 Register (address offset: 0x110).....	112
12.2.47 SDH_VNDR_5 – Vendor-defined 5 Register (address offset: 0x114).....	112
12.2.48 SDH_VNDR_6 – Vendor-defined 6 Register (address offset: 0x118).....	112
12.2.49 SDH_VNDR_7 – Vendor-defined 7 Register (address offset: 0x11C).....	112
12.2.50 SDH_VNDR_8 – Vendor-defined 8 Register (address offset: 0x120).....	113
12.2.51 SDH_VNDR_9 – Vendor-defined 9 Register (address offset: 0x124).....	113
12.2.52 SDH_RSRV_6 – Reserved 6 Register (address offset: 0x128).....	113
12.2.53 SDH_HW_ATTR – Hardware Attributes Register (address offset: 0x178).....	113

12.2.54 SDH_CPR_MOD_CNTL – Cipher Mode Control Register (address offset: 0x180) .....	113
12.2.55 SDH_CPR_MOD_STATUS – Cipher Mode Status Register (address offset: 0x184) .....	115
12.2.56 SDH_CPR_MOD_STATUS_EN – Cipher Mode Status Enable Register (address offset: 0x188).....	115
12.2.57 SDH_CPR_MOD_SIG_EN – Cipher Mode Signal Enable Register (address offset: 0x18A) .....	115
12.2.58 SDH_IN_DATA_LSB –Input Data LSB Register (address offset: 0x18C) .....	115
12.2.59 SDH_IN_DATA_MSB –Input Data MSB Register (address offset: 0x190).....	115
12.2.60 SDH_IN_KEY_LSB – Input Key LSB Register (address offset: 0x194).....	115
12.2.61 SDH_IN_KEY_MSB – Input Key MSB Register (address offset: 0x198) .....	116
12.2.62 SDH_OUT_DATA_LSB – Output Data LSB Register (address offset: 0x19C) .....	116
12.2.63 SDH_OUT_DATA_MSB – Output Data MSB Register (address offset: 0x1A0).....	116
12.2.64 SDH_SCRT_CONS_DATA – Secret Constant Table Data Port (address offset: 0x1A4) .....	116

## **13 UART..... 117**

<b>13.1 Register Summary.....</b>	<b>118</b>
-----------------------------------	------------

<b>13.2 UART MODE SELECTION .....</b>	<b>120</b>
---------------------------------------	------------

<b>13.3 STANDARD 550 COMPATIBLE REGISTERS .....</b>	<b>122</b>
---	------------

13.3.1 UART_RBR - Receiver Buffer Register (address offset: 0x00 and LCR[7] = 0) .....	122
13.3.2 UART_THR - Transmitter Holding Register (address offset: 0x00 and LCR[7] = 0)...	122
13.3.3 UART_DIV_LSB - Divisor LSB Register (address offset: 0x00 and LCR[7] = 1) .....	122
13.3.4 UART_DIV_MSB - Divisor MSB Register (address offset: 0x01 and LCR[7] = 1) .....	122
13.3.5 UART_INT_ENABLE - Interrupt Enable Register (address offset: 0x01) .....	122
13.3.6 UART_INT_STATUS - Interrupt Status Register (address offset: 0x02).....	123
13.3.7 UART_FCR - FIFO Control Register (address offset: 0x02) .....	124
13.3.8 UART_LCR - Line Control Register (address offset: 0x03) .....	126
13.3.9 UART_MCR - Modem Control Register (address offset: 0x04).....	127
13.3.10 UART_LSR - Line Status Register (address offset: 0x05) .....	128
13.3.11 UART_MSR - Modem Status Register (address offset: 0x06) .....	129
13.3.12 UART_SPR - SPR Register (address offset: 0x07) .....	130

<b>13.4 650 COMPATIBLE REGISTERS .....</b>	<b>130</b>
--	------------

13.4.1 UART_EFR - Enhanced Feature Register (address offset: 0x02).....	130
13.4.2 UART_XON1 - XON1 Register (address offset: 0x04) .....	131
13.4.3 UART_XON2 - XON2 Register (address offset: 0x05) .....	131
13.4.4 UART_XOFF1 - XOFF1 Register (address offset: 0x06) .....	131
13.4.5 UART_XOFF2 - XOFF2 Register (address offset: 0x07) .....	131

## **13.5 950 COMPATIBLE REGISTERS ..... 132**

13.5.1 UART_ASR - Additional Status Register (address offset: 0x01).....	132
13.5.2 UART_RFL - Receiver FIFO Level Register (address offset: 0x03) .....	132
13.5.3 UART_TFL - Transmitter FIFO Level Register (address offset: 0x04) .....	132
13.5.4 UART_ICR - ICR Register (address offset: 0x05) .....	133

## **13.6 INDEXED CONTROL REGISTERS ..... 133**

13.6.1 UART_ACR - Additional Control Register (SPR offset: 0x00).....	135
13.6.2 UART_CPR - Clock Prescaler Register (SPR offset: 0x01).....	136
13.6.3 UART_TCR - Time Clock Register (SPR offset: 0x02).....	136
13.6.4 UART_CKS Clock Select Register (SPR offset: 0x03) .....	136
13.6.5 UART_TTL - Transmitter Trigger Level Register (SPR offset: 0x04) .....	137
13.6.6 UART RTL - Receiver Trigger Level Register (SPR offset: 0x05) .....	137
13.6.7 UART_FCL - Flow Control Level LSB Register (SPR offset: 0x06) .....	137
13.6.8 UART_FCH - Flow Control Level Register MSB (SPR offset: 0x07) .....	137
13.6.9 UART_ID1 - Identification 1 Register (SPR offset: 0x08) .....	138
13.6.10 UART_ID2 - Identification 2 Register (SPR offset: 0x09).....	138
13.6.11 UART_ID3 - Identification 3 Register (SPR offset: 0x0A) .....	138
13.6.12 UART_REV - Revision Register (SPR offset: 0x0B) .....	138
13.6.13 UART_CSR - Channel Software Reset Register (SPR offset: 0x0C) .....	138
13.6.14 UART_NMR - Nine Bit Mode Register (SPR offset: 0x0D).....	139
13.6.15 UART_MDM - Modem Disable Mask Register (SPR offset: 0x0E).....	139
13.6.16 UART RFC - Readable FCR Register (SPR offset: 0x0F) .....	140
13.6.17 UART_GDS - Good Data Status Register (SPR offset: 0x10).....	140
13.6.18 UART_RSRV_1 - Reserved 1 Register (SPR offset: 0x11) .....	140
13.6.19 UART_PIDX - Port Index Register (SPR offset: 0x12) .....	140
13.6.20 UART_CKA - Clock Alteration Register (SPR offset: 0x13) .....	140

## **14 Timers and Watchdog ..... 141**

### **14.1 Register Summary..... 142**

### **14.2 Register Details..... 142**

14.2.1 TIMER_CONTROL_0 - Timers Control Register 0 (address offset: 0x00) .....	142
14.2.2 TIMER_CONTROL_1 - Timers Control Register 1 (address offset: 0x01) .....	143
14.2.3 TIMER_CONTROL_2 - Timers Control Register 2 (address offset: 0x02) .....	143
14.2.4 TIMER_CONTROL_3 - Timers Control Register 3 (address offset: 0x03) .....	143
14.2.5 TIMER_CONTROL_4 - Timers Control Register 4 (address offset: 0x04) .....	144
14.2.6 TIMER_INT - Timers Interrupt Register (address offset: 0x05).....	144

14.2.7 TIMER_SELECT - Timers A..D Select Register (address offset: 0x06) .....	144
14.2.8 TIMER_WDG - Watchdog Start Value (address offset: 0x07).....	144
14.2.9 TIMER_WRITE_LS - Timer A..D Start Value 7:0 (address offset: 0x08) .....	145
14.2.10 TIMER_WRITE_MS - Timer A..D Start Value 15:8 (address offset: 0x09).....	145
14.2.11 TIMER_PRESC_LS - Prescaler Start Value 7:0 (address offset: 0x0A).....	145
14.2.12 TIMER_PRESC_MS - Prescaler Start Value 15:8 (address offset: 0x0B) .....	145
14.2.13 TIMER_READ_LS - Timer A..D Current Value 7:0 (address offset: 0x0C) .....	145
14.2.14 TIMER_READ_MS - Timer A..D Current Value 15:8 (address offset: 0x0D) .....	145
<b>15 I2S .....</b>	<b>146</b>
<b>  15.1 Register Summary.....</b>	<b>148</b>
<b>  15.2 Register Details.....</b>	<b>148</b>
15.2.1 I2SCR - Configuration Register 1 (address offset: 0x00) .....	148
15.2.2 I2SCR2 - Configuration Register 2 (address offset: 0x02) .....	149
15.2.3 I2SIRQEN - Interrupt Enable Register (address offset: 0x04).....	150
15.2.4 I2SIRQPEND - Interrupt Pending Register (address offset: 0x06) .....	150
15.2.5 I2SRWDATA - Transmit / Receive Data Register (address offset: 0x08) .....	151
15.2.6 I2SRXCOUNT - RX Count Register (address offset: 0x0C).....	151
15.2.7 I2STXCOUNT - TX Count Register (address offset: 0x0E) .....	151
<b>16 SPI Master .....</b>	<b>152</b>
<b>  16.1 Register Summary.....</b>	<b>152</b>
<b>  16.2 Register Details.....</b>	<b>153</b>
16.2.1 SPIM_CNTL – Control Register (address offset: 0x00).....	153
16.2.2 SPIM_STATUS – Status Register (address offset: 0x04) .....	153
16.2.3 SPIM_DATA – Receiver and Transmitter Data Registers (address offset: 0x08) .....	154
16.2.4 SPIM_SLV_SEL_CNTL – Slave Select Control Register (address offset: 0x0C) .....	154
16.2.5 SPIM_FIFO_CNTL – FIFO Control Register (address offset: 0x10).....	154
16.2.6 SPIM_TNSFR_FRMT_CNTL – Transfer Format Control Register (address offset: 0x14) .....	155
16.2.7 SPIM_ALT_DATA – Alternative SPI Master Data Register (address offset: 0x18).....	155
16.2.8 SPIM_RX_FIFO_COUNT – SPI Master RX FIFO Count Register (address offset: 0x1C) .....	155
<b>17 SPI Slaves .....</b>	<b>156</b>
<b>  17.1 Register Summary.....</b>	<b>156</b>
<b>  17.2 Register Details.....</b>	<b>157</b>

17.2.1 SPIS_CNTL – Control Register (address offset: 0x00) .....	157
17.2.2 SPIS_STATUS – Status Register (address offset: 0x04) .....	157
17.2.3 SPIS_DATA – Receiver and Transmitter Data Registers (address offset: 0x08).....	158
17.2.4 SPIS_SLV_SEL_CNTL – Slave Select Control Register (address offset: 0x0C) .....	158
17.2.5 SPIS_FIFO_CNTL – FIFO Control Register (address offset: 0x10) .....	158
17.2.6 SPIS_TNSFR_FRMT_CNTL – Transfer Format Control Register (address offset: 0x14) .....	159
17.2.7 SPIS_ALT_DATA – Alternative SPI Slave Data Register (address offset: 0x18) .....	159
17.2.8 SPIS_RX_FIFO_COUNT – SPI Slave RX FIFO Count Register (address offset: 0x1C).159

<b>21.2 Register Details.....</b>	<b>174</b>
21.2.1 PWM_CTRL0 - PCM Control Register (address offset: 0x00) .....	174
21.2.2 PWM_CTRL1 - PWM Control Register (address offset: 0x01) .....	174
21.2.3 PWM_PRESCALER - PWM Prescaler Register (address offset: 0x02) .....	175
21.2.4 PWM_CNTL - PWM Counter Register (LSB) (address offset: 0x03) .....	175
21.2.5 PWM_CNTH - PWM Counter Register (MSB) (address offset: 0x04).....	175
21.2.6 PWM_CMP0L - Comparator 0 Value Register (LSB) (address offset: 0x05).....	175
21.2.7 PWM_CMP0H - Comparator 0 Value Register (MSB) (address offset: 0x06) .....	176
21.2.8 PWM_CMP1L - Comparator 1 Value Register (LSB) (address offset: 0x07).....	176
21.2.9 PWM_CMP1H - Comparator 1 Value Register (MSB) (address offset: 0x08) .....	176
21.2.10 PWM_CMP2L - Comparator 2 Value Register (LSB) (address offset: 0x09) .....	176
21.2.11 PWM_CMP2H - Comparator 2 Value Register (MSB) (address offset: 0x0A).....	176
21.2.12 PWM_CMP3L - Comparator 3 Value Register (LSB) (address offset: 0x0B) .....	176
21.2.13 PWM_CMP3H - Comparator 3 Value Register (MSB) (address offset: 0x0C).....	176
21.2.14 PWM_CMP4L - Comparator 4 Value Register (LSB) (address offset: 0x0D).....	177
21.2.15 PWM_CMP4H - Comparator 4 Value Register (MSB) (address offset: 0x0E).....	177
21.2.16 PWM_CMP5L - Comparator 5 Value Register (LSB) (address offset: 0x0F) .....	177
21.2.17 PWM_CMP5H - Comparator 5 Value Register (MSB) (address offset: 0x10).....	177
21.2.18 PWM_CMP6L - Comparator 6 Value Register (LSB) (address offset: 0x11) .....	177
21.2.19 PWM_CMP6H - Comparator 6 Value Register (MSB) (address offset: 0x12).....	177

21.2.20 PWM_CMP7L - Comparator 7 Value Register (LSB) (address offset: 0x13) .....	177
21.2.21 PWM_CMP7H - Comparator 7 Value Register (MSB) (address offset: 0x14) .....	178
21.2.22 PWM_TOGGLE0 - Channel 0 OUT Toggle Comparator Mask Register (address offset: 0x15) .....	178
21.2.23 PWM_TOGGLE1 - Channel 1 OUT Toggle Comparator Mask Register (address offset: 0x16) .....	178
21.2.24 PWM_TOGGLE2 - Channel 2 OUT Toggle Comparator Mask Register (address offset: 0x17) .....	178
21.2.25 PWM_TOGGLE3 - Channel 3 OUT Toggle Comparator Mask Register (address offset: 0x18) .....	178
21.2.26 PWM_TOGGLE4 - Channel 4 OUT Toggle Comparator Mask Register (address offset: 0x19) .....	178
21.2.27 PWM_TOGGLE5 - Channel 5 OUT Toggle Comparator Mask Register (address offset: 0x1A) .....	179
21.2.28 PWM_TOGGLE6 - Channel 6 OUT Toggle Comparator Mask Register (address offset: 0x1B) .....	179
21.2.29 PWM_TOGGLE7 - Channel 7 OUT Toggle Comparator Mask Register (address offset: 0x1C) .....	179
21.2.30 PWM_OUT_CLR_EN - PWM OUT Clear Enable Register (address offset: 0x1D) .....	179
21.2.31 PWM_CTRL_BL_CMP8 - Control Block CMP8 Value Register (address offset: 0x1E) .....	179
21.2.32 PWM_INIT - PWM Initialization Register (address offset: 0x1F) .....	179
21.2.33 PWM_INTMASK - PWM Interrupt Mask Register (address offset: 0x20) .....	180
21.2.34 PWM_INTSTATUS - PWM Interrupt Status Register (address offset: 0x21) .....	180
21.2.35 PWM_SAMPLE_FREQ_H - PWM Data Sampling Frequency High Byte Register (address offset: 0x22) .....	180
21.2.36 PWM_SAMPLE_FREQ_L - PWM Data Sampling Frequency Low Byte Register (address offset: 0x23) .....	181
21.2.37 PCM_VOLUME - PCM Volume Register (address offset: 0x24) .....	181
21.2.38 PWM_BUFFER - PCM Buffer Register (address offset: 0x3C) .....	181

## 1 Introduction

FT900 is a programmable System-on-Chip device with a 12132-bit general purpose embedded microprocessor core and a plethora of connectivity options. It has been developed for high speed, data bridging tasks. With a parallel data capture interface, 10/100 Base-TX Ethernet interface, CAN bus, and USB 2.0 Hi-Speed peripheral and host ports, this device offers excellent interconnect capabilities and blazing computational power. The description of the general system registers, as well as the register set of various peripheral interfaces, is explained in detail in this document.

## 2 FT900 System Architecture

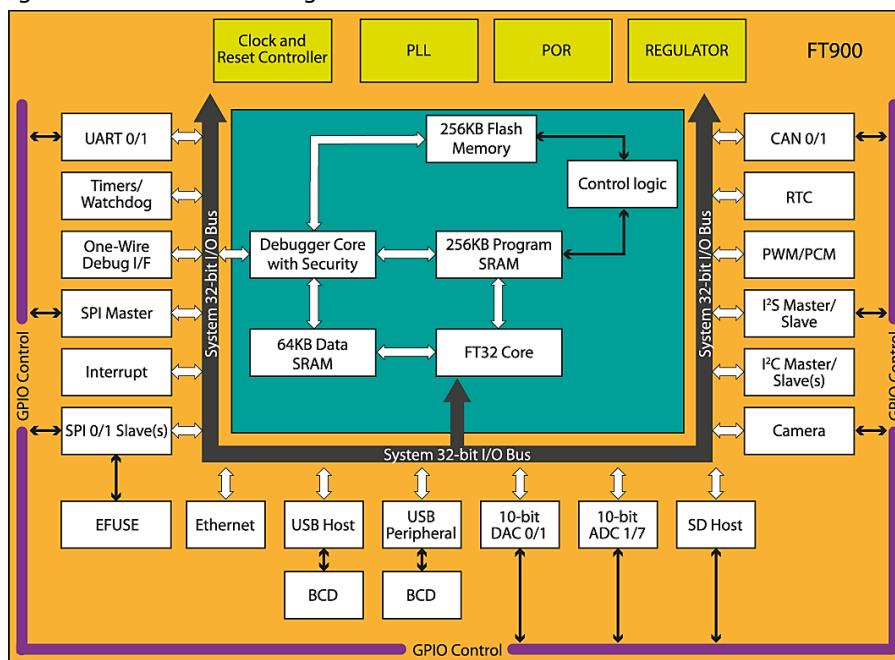

### 2.1 Architecture Overview

The FT900 core contains the 32-bit CPU (FT32), with control logic, flash memory and RAM. The flash memory size is 256 KB. The RAM consists of 256 KB shadow program memory and 64 KB data memory. Upon reset, the content of the flash memory is copied into the shadow program memory for fastest execution. The outside connections for the FT900 core are the memory-mapped I/O interface, the interrupt interface, synchronous reset and the clock.

The peripherals of the FT900 series include:

- 1 high-speed USB host interface, which supports USB Battery Charging Specification Rev 1.2. It can be configured as SDP, CDP or DCP.
- 1 high-speed USB device interface, which supports USB Battery Charging Specification Rev 1.2. It can perform BCD mode detection.
- 2 programmable UARTs
- SPI master interface
- 2 SPI slave interfaces
- 7-channel PWM blocks with optional digital filter on channel 0 and 1
- I2C master interface
- I2C slave interface
- I2S master / slave interface
- SD host interface
- 2 CAN interfaces
- Ethernet
- RTC
- Watchdog & 4 16-bit general purpose timers
- Debug interface
- 7-channel 10-bit 1MS/s ADC
- 2-channel 10-bit 1MS/s DAC
- 67 multi-purpose GPIOs

The block diagram shown below in Figure 2.1 illustrates the main IP blocks of FT900.

**Figure 2.1 - FT900 System Architecture**

## 2.2 Memory Organization

The first 144 bytes in the Program Memory contains the followings:

- Reset vector
- Watchdog vector
- 32 interrupt vectors
- 1 non-maskable interrupt vector (reserved for the debugger)
- Program entry point

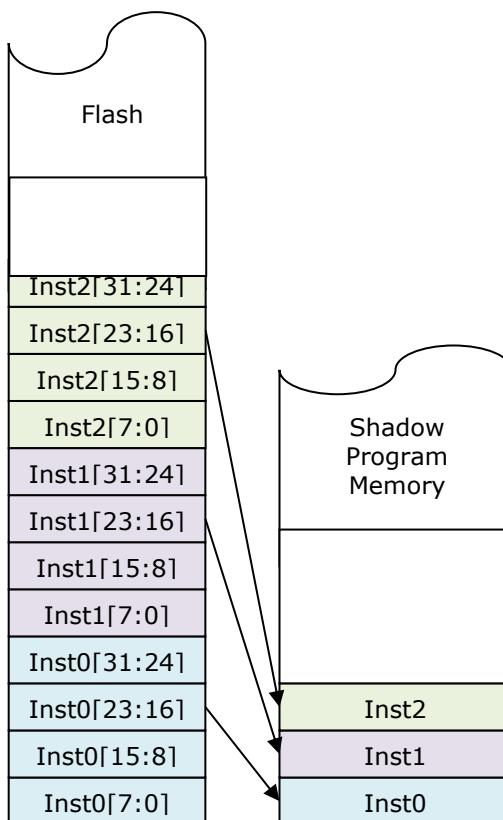

Address	Function
0x00	Reset vector
0x04	Watchdog vector
0x08	Interrupt vector 0
0x0C	Interrupt vector 1
...	...
0x80	Interrupt vector 30
0x84	Interrupt vector 31
0x88	Interrupt vector 32 (NMI)
0x8C	Program entry point

**Table 2.1 - FT900 Program Memory Organization**

## 2.3 FT900 Boot Control

Upon reset, boot control takes control of the memory buses and puts the CPU in a reset state.

It automatically transfers the data from the flash memory to the CPU program memory, starting from address 0 on both sides. Boot control calculates a CRC check over the entire contents of flash (256KB) and the result is placed in CRCH and CRCL registers found in the flash control module.

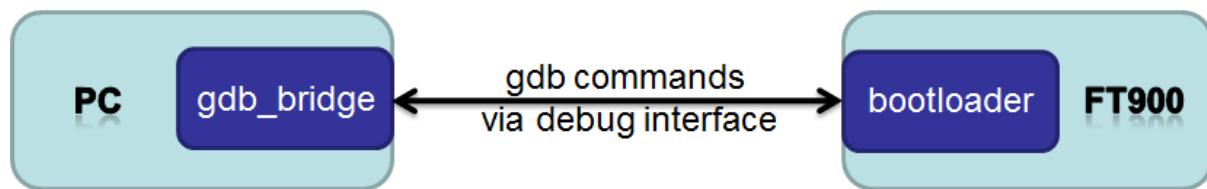

**Figure 2.2 - FT900 Boot Control**

## 2.4 Debugging Support

Debugging the FT900 series is carried out via the one-wire interface. The debugging support is implemented in the FT900 bootloader. The protocol used for debugging is the GDB remote protocol and a port of GDB is available in the Bridgetek FT9XX Toolchain. The GDB serial debug protocol commands are interpreted by a debug interpreter in the bootloader.

In addition, the debug interpreter:

- saves all machine states
- executes commands received over the debug interface
- restores all machine states and returns

**Figure 2.3 - FT900 Debugging Support**

### 3 Register Map

This section lists the I/O map for registers / memory in the device. Please note that some peripherals are not available on some models in the FT900 series. The details can be found in the table below. An (X) indicates that the peripheral exists and a minus (-) indicates that the peripheral is not available. All other peripherals that are not mentioned are available on all models in the series.

	CAN	Ethernet	Camera	SD Host	I2S
<b>FT900Q/FT9 00L</b>	X	X	X	X	X
<b>FT901Q/FT9 01L</b>	-	X	X	X	X
<b>FT902Q/FT9 02L</b>	X	-	X	X	X
<b>FT903Q/FT9 03L</b>	-	-	X	X	X
<b>FT905Q/FT9 05L</b>	X	X	-	-	-
<b>FT906Q/FT9 06L</b>	-	X	-	-	-
<b>FT907Q/FT9 07L</b>	X	-	-	-	-
<b>FT908Q/FT9 08L</b>	-	-	-	-	-

**Table 3.1 - Peripheral Availability on FT900 Series Models**

The register map of the peripherals is as follows:

Function	Address Base Range			Access Mechanism
General Setup		0x10000	0x100BF	DW, W, B
Interrupt Controller		0x100C0	0x100FF	DW, W, B
USB Host		0x10100	0x1017F	DW, W, B
USB Host RAM		0x11000	0x12FFF	DW, W, B
USB Device		0x10180	0x1021F	B
Ethernet		0x10220	0x1023F	DW, W, B (DW for FIFO)
CAN 0		0x10240	0x1025F	B
CAN 1		0x10260	0x1027F	B
RTC		0x10280	0x1029F	DW
SPI Master		0x102A0	0x102BF	DW
SPI Slave 0		0x102C0	0x102DF	DW
SPI Slave 1		0x102E0	0x102FF	DW
I2C Master		0x10300	0x1030F	B
I2C Slave		0x10310	0x1031F	B
UART 0		0x10320	0x1032F	B
UART 1		0x10330	0x1033F	B
Timers/Watchdog		0x10340	0x1034F	B
I2S (Master/Slave)		0x10350	0x1035F	W
Data Capture		0x10360	0x1036F	DW
PWM		0x103C0	0x103FF	B for registers, W for FIFO
SD Host		0x10400	0x107FF	DW
Flash Controller		0x10800	0x108BF	B

\* DW (Double-Word): 32-bit; W (Word): 16-bit; B (Byte): 8-bit

**Table 3.2 - Register Map for FT900 Series**

## 4 Notations

These notations are used in the register descriptions:

Terms	Description
Reserved	Do not read/write the location
RO	Read-only
ROC	Read-only / Clear-when-read
RW	Read- and Write-able
RW1C	Read and Write-1-to-clear
RW1S	Read and Write-1-to-set
RWAC	Read- and Write-able with automatic clear
W1S	Write-1-to-set
W1T	Write-1-to-trigger-event
WO	Write-only

**Table 4.1 - Notations used in Register Description**

## 5 General System Registers

This section describes the registers that govern the general behavior of the FT900.

### 5.1 Register Summary

Listed below are the registers with their offset from the base address (0x10000). All registers can be accessed via Byte (8-bit), Word (16-bit) or Double-Word (32-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	CHIPID - Chip ID Register	0x09XXXXXX	<a href="#">Section 5.2.1</a>
<b>0x04</b>	EFCFG - Chip Configuration Register	0xXXXXXXXXX	<a href="#">Section 5.2.2</a>
<b>0x08</b>	CLKCFG - Clock Configuration Register	0x00000000	<a href="#">Section 5.2.3</a>
<b>0x0C</b>	PMCFG - Power Management Register	0x00000000	<a href="#">Section 5.2.4</a>
<b>0x10</b>	PTSTNSET - Test & Set Register	0x00001000	<a href="#">Section 5.2.5</a>
<b>0x14</b>	PTSTNSETR - Test & Set Shadow Register	0x00000000	<a href="#">Section 5.2.6</a>
<b>0x18</b>	MSC0CFG - Miscellaneous Configuration Register	0x00000000	<a href="#">Section 5.2.7</a>
<b>0x1C</b>	Pin 00 – 03 Register	0x04080808	<a href="#">Section 5.2.8.1</a>
<b>0x20</b>	Pin 04 – 07 Register	0x04040404	<a href="#">Section 5.2.8.2</a>
<b>0x24</b>	Pin 08 – 11 Register	0x04040404	<a href="#">Section 5.2.8.3</a>
<b>0x28</b>	Pin 12 – 15 Register	0x04040404	<a href="#">Section 5.2.8.4</a>
<b>0x2C</b>	Pin 16 – 19 Register	0x04040404	<a href="#">Section 5.2.8.5</a>
<b>0x30</b>	Pin 20 – 23 Register	0x04040404	<a href="#">Section 5.2.8.6</a>

**Table 5.1 - Overview of General System Registers**

## 5.2 Register Details

### 5.2.1 CHIPID - Chip ID Register (address offset: 0x00)

This register is read-only.

Bit	Name	Type	Default Value	Description
31:0	Chip ID	RO	0x09XXXXXX	The two MSBs (09XX) depict FT900 series and the two LSBs (XXXX) shows the revision of the chip.

**Table 5.2 - CHIPID - Chip ID Register**

For revision 0001 of the FT900 series, the pre-configured bits of the chip ID register (CHIPID) and the chip configuration register (EFCFG, [section 5.2.2](#)) for different models are listed in the table below. Note that these bits are always read-only.

	<b>CHIPID [31..16]</b>	<b>CHIPID [15..0]</b>	<b>EFCFG [31]</b>	<b>EFCFG [30]</b>	<b>EFCFG [29]</b>
<b>FT900Q/FT900L</b>	0X0900	0X0001	1	1	1
<b>FT901Q/FT901L</b>	0X0901	0X0001	0	1	1
<b>FT902Q/FT902L</b>	0X0902	0X0001	1	0	1
<b>FT903Q/FT903L</b>	0X0903	0X0001	0	0	1
<b>FT905Q/FT905L</b>	0X0905	0X0001	1	1	0
<b>FT906Q/FT906L</b>	0X0906	0X0001	0	1	0
<b>FT907Q/FT907L</b>	0X0907	0X0001	1	0	0
<b>FT908Q/FT908L</b>	0X0908	0X0001	0	0	0

**Table 5.3 - FT900 Series Revision 0001 Configuration**

### 5.2.2 EFCFG - Chip Configuration Register (address offset: 0x04)

This register contains read-only information. Some bits are user configurable via EFUSE. More details can be found in the [EFUSE section](#). Specifically, bits 27..26 and bits 20..0 are EFUSE configurable.

Bit	Name	Type	Default Value	Description
31	CAN_ACTIVE	RO	X	CAN modules available; the value depends on device model; 1 – available; 0 – not available.
30	MAC_ACTIVE	RO	X	Ethernet module available; default value depends on device model; 1 – available; 0 – not available.
29	100_PIN	RO	X	1 - the device is a 100-pin device; 0 - the device is a 76-pin (QFN) or 80-pin (LQFP) device.
28	Reserved	RO	0	Always read as '0'
27	1-Wire_ACTIVE	RO	X	If set, one-wire debug interface is enabled; otherwise, it's permanently disabled.
26	EXT_SPI_ACTIVE	RO	X	If set, internal FLASH/EFUSE can be accessed via SPI Slave interface during reset; otherwise, this interface is permanently disabled.
25:21	Reserved	RO	5'h1F	Reserved
20	FLASH_RD_ENA	RO	X	If set, FLASH read via the external SPI interface is allowed; otherwise, this feature is permanently disabled. Write will still be available; but see bits 19-16

Bit	Name	Type	Default Value	Description
19	FLASH_WR_B3_ENA	RO	X	If set, FLASH write/erase to bytes 196608 – 262143 is allowed; otherwise, it is permanently non-writable/non-erasable.
18	FLASH_WR_B2_ENA	RO	X	If set, FLASH write/erase to bytes 131072 – 196607 is allowed; otherwise, it is permanently non-writable/non-erasable.
17	FLASH_WR_B1_ENA	RO	X	If set, FLASH write/erase to bytes 65536 – 131071 is allowed; otherwise, it is permanently non-writable/non-erasable.
16	FLASH_WR_B0_ENA	RO	X	If set, FLASH write/erase to bytes 0 – 65535 is allowed; otherwise, it is permanently non-writable/non-erasable.
15:0	FLASH_CODE_RD	RO	X	Each bit corresponds 16kB of FLASH location, with bit 0 referring to locations 0-16383. When set the data residing in the said FLASH locations are not considered sensitive and when copied to the program memory, the user program can access these as data via LPM/LPMI instructions. When cleared, the data are considered sensitive; reading them from the program memory with LPM/LPMI instructions will not return the correct content.

**Table 5.4 - EFCFG - Chip Configuration Register**

### 5.2.3 CLKCFG - Clock Configuration Register (address offset: 0x08)

Bit	Name	Type	Default Value	Description
31:16	Reserved	-	-	Reserved
15	EHCI_ENA	RW	0	1: enable USB Host
14	DEV_ENA	RW	0	1: enable USB Peripheral
13	MAC_ENA	RW	0	1: enable Ethernet
12	SD_ENA	RW	0	1: enable SD Host
11	CAN0_ENA	RW	0	1: enable CAN0
10	CAN1_ENA	RW	0	1: enable CAN1
9	I2CM_ENA	RW	0	1: enable I2C Master
8	I2CS_ENA	RW	0	1: enable I2C Slave
7	SPI_M_ENA	RW	0	1: enable SPI Master
6	SPI_S0_ENA	RW	0	1: enable SPI Slave 0
5	SPI_S1_ENA	RW	0	1: enable SPI Slave 1
4	UART0_ENA	RW	0	1: enable UART 0
3	UART1_ENA	RW	0	1: enable UART 1
2	PWM_ENA	RW	0	1: enable PWM
1	I2S_ENA	RW	0	1: enable I2S
0	CAM_ENA	RW	0	1: enable Data Capture Interface

**Table 5.5 - CLKCFG - Clock Configuration Register**

### 5.2.4 PMCFG - Power Management Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
31:26	Reserved	RO	0	
25	PM_GPIO_IRQ_PEND	RW1C	0	GPIO interrupt during system shut down with clock not running
24	SLOWCLK_5ms_IRQ_PEND	RW1C	0	Slow clock 5ms timer interrupt pending; write 1 to clear. If enabled, an interrupt will be generated.
23	RM_WK_HOST	RW1C	0	Remote Wakeup Interrupt pending to USB Host; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
22	DEV_CONN_HOST	RW1C	0	Device Connect Interrupt pending to USB Host; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
21	DEV_DIS_HOST	RW1C	0	Device Disconnect Interrupt pending to USB Host; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
20	DEV_CONN_DEV	RW1C	0	Device Connect Interrupt pending to USB Device; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
19	DEV_DIS_DEV	RW1C	0	Device Disconnect Interrupt pending to USB Device; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
18	HOST_RST_DEV	RW1C	0	Host Reset Interrupt pending to USB Device; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
17	HOST_RESUME_DEV	RW1C	0	Host Resume Interrupt pending to USB Device; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
16	OC_DETECT	RW1C	0	Over current detected Interrupt pending if enabled; write 1 to clear. If enabled, an interrupt will be generated on PM IRQ.
15:11	Reserved	RO	0	
10	DEV_PHY_EN	RW	0	1: Enable USB Device PHY
9	PM_PWRDN_MODE	RW	0	1: disable system oscillator when powering down 0: do not disable system oscillator when powering down
8	PM_PWRDN	RW	0	1: power down system. This bit should be cleared after the system wakes up or at least 60-100us prior to setting it 1 again.
7	SLOWCLOCK_5ms_IRQ_EN	RW	0	1: enable slow clock 5ms timer interrupt.
6	SLOWCLOCK_5ms_START	RWA C	0	1: To start the 1-shot slow clock 5ms timer; once started it cannot be stopped. This bit will be cleared automatically when the timer expires.
5	FORCE_HOST_DET	RW	0	Normally USB host activity detection is performed only when required; setting

Bit	Name	Type	Default Value	Description
				this bit will force the PM to check for host connection activities regardless.
4	FORCE_DEV_DET	RW	0	Normally USB device activity detection is performed only when required; setting this bit will force the PM to check for device connection activities regardless.
3	RM_WK_HOST_EN	RW	0	1: enable remote wake up detection to USB host. Enable interrupt to PM IRQ when RM_WK_HOST is set.
2	HOST_DETECT_EN	RW	0	1: enable device connect/disconnect detection to USB Host. Enable interrupt to PM IRQ when either DEV_CONN_HOST or DEV_DIS_HOST is set.
1	DEV_DETECT_EN	RW	0	1: enable device connect/disconnect to external host or external host reset detection. Enable interrupt to PM IRQ when any of DEV_CONN_DEV, DEV_DIS_DEV and HOST_RST_DEV is set.
0	OC_DETECT_EN	RW	0	1: Enable Over current detection. Enable interrupt to PM IRQ when OC_DETECT is set

**Table 5.6 - PMCFC - Power Management Register**

#### 5.2.5 PTSTNSET - Test & Set Register (address offset: 0x10)

Bit	Name	Type	Default Value	Description
31:1	Reserved	RO	0	
0	TEST_SET	RW1C	0	<p>This register is used as a binary semaphore. Upon a read, a 0 indicates that the semaphore has been granted to the reader and a 1 indicates that it has already been taken.</p> <p><b>CAUTION:</b> Only the granted thread or process shall write a 1 to return the semaphore.</p>

**Table 5.7 - PTSTNSET - Test & Set Register**

#### 5.2.6 PTSTNSETR - Test & Set Shadow Register (address offset: 0x14)

Bit	Name	Type	Default Value	Description
31:1	Reserved	RO	0	
0	TEST_SET	RW1C	0	<p>This register is used as a binary semaphore. Upon a read, a 0 indicates that the semaphore has been granted to the reader and a 1 indicates that it has already been taken.</p> <p><b>CAUTION:</b> Only the granted thread or process shall write a 1 to return the semaphore.</p>

**Table 5.8 - PTSTNSETR - Test & Set Shadow Register**

### 5.2.7 MSC0CFG - Miscellaneous Configuration Register (address offset: 0x18)

Bit	Name	Type	Default Value	Description
31	PERI_SOFTRESET	RWAC	0	Write 1 to cause soft reset to all peripherals. It is automatically cleared.
30	PWM_SOFTRESET	RWAC	0	Write 1 to cause soft reset to PWM. It is automatically cleared.
29	I2C_SWOP	RW	0	0: I2C master function is available at GPIO44 and GPIO45 and I2C slave function is available at GPIO46 and GPIO47 1: swap the I2C master and I2C slave GPIO positions
28:26	PWM_TRIG_SEL	RW	0	PWM count external trigger selection (See PWM) If any of the GPIO is used for this purpose, the pad must be configured solely for this use. 0: none 1: GPIO 18 2: GPIO 26 3: GPIO 35 4: GPIO 40 5: GPIO 46 6: GPIO 52 7: GPIO 58
25:24	Reserved	-	-	
23	CAN0_SLOW	RW	0	1: Extend further the divider of CAN 0 by a factor of 16.
22	CAN1_SLOW	RW	0	1: Extend further the divider of CAN 1 by a factor of 16.
21	UART0_CLKSEL	RW	0	Clock Select for UART 0. Refer to UART chapter for more information on this bit.
20	UART0_FIFOSEL	RW	0	FIFO Selection for UART 0. Refer to UART chapter for more information on this bit.
19	UART0_INTSEL	RW	0	INT Selection for UART 0. Refer to UART chapter for more information on this bit.
18	UART1_CLKSEL	RW	0	Clock Select for UART 1. Refer to UART chapter for more information on this bit.
17	UART1_FIFOSEL	RW	0	FIFO Selection for UART 1. Refer to UART chapter for more information on this bit.
16	UART1_INTSEL	RW	0	INT Selection for UART 1. Refer to UART chapter for more information on this bit.
15	HOST_RESET_ALL	RWAC	0	Write 1 to cause USB Host EHCI and PHY reset; it is automatically cleared immediately. Software needs to wait

Bit	Name	Type	Default Value	Description
				for EHCI to complete its reset (~200ms).
14	HOST_RESET_EHCI	RWAC	0	Write 1 to cause USB Host EHCI reset; it is automatically cleared immediately. Software needs to wait for EHCI to complete its reset (~200ms).
13	HOST_RESET_ATX	RWAC	0	Write 1 to cause USB Host PHY reset; it is automatically cleared immediately.
12	DEV_RM_WAKEUP	RW	0	1: Drive K-state on Device USB port; software must maintain the 1ms requirement before turning it off.
11	DEV_RESET_ALL	RWAC	0	Write 1 to cause USB Dev Controller and ATX reset; it is automatically cleared immediately.
10	DEV_RESET_CONTROLLER	RWAC	0	Write 1 to cause USB Dev Controller reset; it is automatically cleared immediately.
9	DEV_RESET_ATX	RWAC	0	Write 1 to cause USB Dev ATX reset; it is automatically cleared immediately.
8	MAC_RESET_PHY	RW	0	Write 1 to cause Ethernet PHY reset; it is automatically cleared immediately.
7:6	BCDHOST_MODE	WO	0	Battery Charging Device (BCD) Host Mode: 0: Standard Downstream Port (SDP) 1: Dedicated Charging Port (DCP) 2: Reserved 3: Charging Downstream Port (CDP)
5	BCDHOST_EN	WO	0	1: enable BCD Host
4	BCD_SOFTRESET	W1C	0	1: Generate software reset to BCD Host: if BCDHOST_EN is 1 BCD Dev: if BCDDEV_EN is 1 It is automatically cleared immediately
4	BCDDEV_DETECT_RUNNING	RO	0	1: indicates BCD Device detection is running
3	BCDDEV_EN	WO	0	1: enable BCD Device
3	BCDDEV_DETECT_COMPLETE	RO	0	1: indicates BCD Device detection is done
2	BCDDEV_SD_EN	WO	1	1: enable secondary detection; refer to BCD IP document for details.
2	BCDDEV_SD_PFOUND	RO	0	1: SDP detected
1	BCDDEV_VDP_EN_POST_DCP	WO	0	1: enable connection of VDP_SRC after DCP detection; refer to BCD IP document for details.
1	BCDDEV_CDP_FOUND	RO	0	1: CDP detected
0	BCDDEV_LGC_COMP_INHIB	WO	1	1: disable logic comparison during BCD detections; refer to BCD IP document for details.

Bit	Name	Type	Default Value	Description
0	BCDDEV_DCP_FOUND	RO	0	1: DCP detected

**Table 5.9 - MSC0CFG - Miscellaneous Configuration Register**

### 5.2.8 GPIO Pin Configuration Registers (address offset: 0x1C – 0x5F)

These registers control the pin configurations. Each register houses the configuration for 4 digital pins except the last register, which only configures 3 pins (64 to 66). Each byte of the register configures 1 digital pin. The pin direction for each of the special functions is fixed and will be set automatically. A pin that is configured as a GPIO can be further configured. Refer to the GPIO Configuration Registers in [section 5.2.9](#).

The bit layout for the Pin Configuration Registers is as follows:

Bit	Description	Value	Configuration
31:30		00	GPIO Function
23:22	Pin Functionality	01	Special Function 1
15:14		10	Special Function 2 (if available)
7:6		11	Special Function 3 (if available)
29:28		00	4mA
21:20	Output drive capability	01	8mA
13:12		10	12mA
5:4		11	16mA
27:26		00	None
19:18	With Pull-up / Pull-down	01	75kΩ Pull-down
11:10		10	75kΩ Pull-up
3:2		11	75kΩ Keeper
25		0	Normal
17	Schmitt	1	Schmitt
9			
1			
24		0	Fast
16	Slew Rate	1	Slow
8			
0			

**Table 5.10 - Pin Configuration Register Description**

The following tables give more details about each Pin Configuration Register. The “Pin Functionality Bits” section refers to bits 31:30, 23:22, 15:14, 7:6 in each register for configuring the corresponding pin to perform a specific functionality. Refer to table 5.10 above.

#### 5.2.8.1 Pin 00 – 03 Register (address offset: 0x1C)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN03_CFG	RW	8'h04	GPIO 3	VBUS Detect	-	-
23:16	PIN02_CFG	RW	8'h08	GPIO 2	-	-	-
15:8	PIN01_CFG	RW	8'h08	GPIO 1	OCN	-	-
7:0	PIN00_CFG	RW	8'h08	GPIO 0	-	-	-

**Table 5.11 - Pin 00 – 03 Register**

#### 5.2.8.2 Pin 04 – 07 Register (address offset: 0x20)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN07_CFG	RW	8'h04	GPIO 7	Cam Pclk	-	ADC Ch2
23:16	PIN06_CFG	RW	8'h04	GPIO 6	Cam Ext Clk	-	ADC Ch1
15:8	PIN05_CFG	RW	8'h04	GPIO 5	Ethernet LED 1	-	-
7:0	PIN04_CFG	RW	8'h04	GPIO 4	Ethernet LED 0	-	-

**Table 5.12 - Pin 04 – 07 Register**

#### 5.2.8.3 Pin 08 – 11 Register (address offset: 0x24)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN11_CFG	RW	8'h04	GPIO 11	Cam D6	-	ADC Ch6
23:16	PIN10_CFG	RW	8'h04	GPIO 10	Cam D7	-	ADC Ch5
15:8	PIN09_CFG	RW	8'h04	GPIO 9	Cam HD	-	ADC Ch4
7:0	PIN08_CFG	RW	8'h04	GPIO 8	Cam VD	-	ADC Ch3

**Table 5.13 - Pin 08 – 11 Register**

#### 5.2.8.4 in 12 – 15 Register (address offset: 0x28)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN15_CFG	RW	8'h04	GPIO 15	Cam D2	CAN 0 Tx	-
23:16	PIN14_CFG	RW	8'h04	GPIO 14	Cam D3	-	DAC Ch0
15:8	PIN13_CFG	RW	8'h04	GPIO 13	Cam D4	-	DAC Ch1
7:0	PIN12_CFG	RW	8'h04	GPIO 12	Cam D5	-	ADC Ch7

**Table 5.14 - Pin 12 – 15 Register**

#### 5.2.8.5 Pin 16 – 19 Register (address offset: 0x2C)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN19_CFG	RW	8'h04	GPIO 19	SD CLK	-	-
23:16	PIN18_CFG	RW	8'h04	GPIO 18	-	CAN 1 Rx	-
15:8	PIN17_CFG	RW	8'h04	GPIO 17	Cam D0	CAN 1 Tx	-
7:0	PIN16_CFG	RW	8'h04	GPIO 16	Cam D1	CAN 0 Rx	-

**Table 5.15 - Pin 16 – 19 Register**

#### 5.2.8.6 Pin 20 – 23 Register (address offset: 0x30)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN23_CFG	RW	8'h04	GPIO 23	SD DAT1	-	-
23:16	PIN22_CFG	RW	8'h04	GPIO 22	SD DAT2	-	-
15:8	PIN21_CFG	RW	8'h04	GPIO 21	SD DAT3	-	-
7:0	PIN20_CFG	RW	8'h04	GPIO 20	SD CMD	-	-

**Table 5.16 - Pin 20 – 23 Register**

#### 5.2.8.7 Pin 24 – 27 Register (address offset: 0x34)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN27_CFG	RW	8'h04	GPIO 27	SPIM SCK	-	-
23:16	PIN26_CFG	RW	8'h04	GPIO 26	SD WP	-	-
15:8	PIN25_CFG	RW	8'h04	GPIO 25	SD CD	-	-
7:0	PIN24_CFG	RW	8'h04	GPIO 24	SD DAT0	-	-

**Table 5.17 - Pin 24 – 27 Register**

#### 5.2.8.8 Pin 28 – 31 Register (address offset: 0x38)

Bit	Name	Type	Default Value	Pin Functionality Bits			
				00	01	10	11
31:24	PIN31_CFG	RW	8'h04	GPIO 31	SPIM IO2	-	-
23:16	PIN30_CFG	RW	8'h04	GPIO 30	SPIM MISO	-	-

**Table 5.27 - Pin 64 – 66 Register**

### 5.2.9 GPIO Configuration Registers (address offset: 0x60 – 0x83)

These registers control the GPIO configurations. Each register houses the configuration for 8 digital pads except the last register, which only configures 3 pads (64 to 66). Each nibble of the register configures 1 digital pad.

All GPIOs can function as an interrupt. The polarity can be either positive edge or negative edge if its interrupt capability is enabled. **If this feature is desired, the pad must be configured as a GPIO input. Otherwise, unpredictable behavior may result.**

**There is no de-bouncing for all GPIO's. If they are used as general inputs, and de-bouncing is needed, then software must handle this. If it's to be used as an interrupt, the external interrupt source should be glitch free.**

The bit layout for the GPIO Configuration Registers is as follows:

Bit	Description	Value	Configuration
31:30 27:26 23:22 19:18 15:14 11:10 7:6 3:2	GPIO Direction	00 01 1X	Input Output Open Drain Output
29 25 21 17 13 9 5 1	Interrupt Capable (Also see section <a href="#">5.2.11</a> , "GPIO Interrupt Enable Registers")	0 1	No Yes
28 24 20 16 12 8 4 0	Interrupt Edge (only if Interrupt Capable bit is 1)	0 1	Falling Edge Rising Edge

**Table 5.28 - GPIO Configuration Register Description**

The following tables give more details about which bits control a specific GPIO Pin using the values from Table 5.28.

### 5.2.9.1 GPIO 00 – 07 Configuration Register (address offset: 0x60)

Bit	Name	Type	Default Value	Description
31:28	GPIO07_CFG	RW	0	For GPIO 7
27:24	GPIO06_CFG	RW	0	For GPIO 6
23:20	GPIO05_CFG	RW	0	For GPIO 5
19:16	GPIO04_CFG	RW	0	For GPIO 4
15:12	GPIO03_CFG	RW	0	For GPIO 3
11:8	GPIO02_CFG	RW	0	For GPIO 2
7:4	GPIO01_CFG	RW	0	For GPIO 1
3:0	GPIO00_CFG	RW	0	For GPIO 0

**Table 5.29 - GPIO 00 – 07 Configuration Register**

### 5.2.9.2 GPIO 08 – 15 Configuration Register (address offset: 0x64)

Bit	Name	Type	Default Value	Description
31:28	GPIO15_CFG	RW	0	For GPIO 15
27:24	GPIO14_CFG	RW	0	For GPIO 14
23:20	GPIO13_CFG	RW	0	For GPIO 13
19:16	GPIO12_CFG	RW	0	For GPIO 12
15:12	GPIO11_CFG	RW	0	For GPIO 11
11:8	GPIO10_CFG	RW	0	For GPIO 10
7:4	GPIO09_CFG	RW	0	For GPIO 9
3:0	GPIO08_CFG	RW	0	For GPIO 8

**Table 5.30 - GPIO 08 – 15 Configuration Register**

### 5.2.9.3 GPIO 16 – 23 Configuration Register (address offset: 0x68)

Bit	Name	Type	Default Value	Description
31:28	GPIO23_CFG	RW	0	For GPIO 23
27:24	GPIO22_CFG	RW	0	For GPIO 22
23:20	GPIO21_CFG	RW	0	For GPIO 21
19:16	GPIO20_CFG	RW	0	For GPIO 20
15:12	GPIO19_CFG	RW	0	For GPIO 19
11:8	GPIO18_CFG	RW	0	For GPIO 18
7:4	GPIO17_CFG	RW	0	For GPIO 17
3:0	GPIO16_CFG	RW	0	For GPIO 16

Bit	Name	Type	Default Value	Description
31:12	Reserved	-	-	-
11:8	GPIO66_CFG	RW	0	For GPIO 66
7:4	GPIO65_CFG	RW	0	For GPIO 65
3:0	GPIO64_CFG	RW	0	For GPIO 64

**Table 5.37 - GPIO 64 – 66 Configuration Register**

### 5.2.10 GPIO Value Registers (address offset: 0x84 – 0x8F)

These registers contain the values for the GPIO pins. Each register contains the value of 32 digital pins except the last register, which only contains the value of 3 pins (64 to 66). Each bit of the register maps to the corresponding digital pin.

#### 5.2.10.1 GPIO 00 – 31 Value Register (address offset: 0x84)

Bit	Name	Type	Default Value	Description
31:0	GPIO_VAL_IN[31:0]	RO	X	Input values of GPIO 31 – 0
31:0	GPIO_VAL_OUT[31:0]	WO	0	Output values of GPIO 31 – 0

Table 5.38 - GPIO 00 – 31 Value Register

#### 5.2.10.2 GPIO 32 – 63 Value Register (address offset: 0x88)

Bit	Name	Type	Default Value	Description
31:0	GPIO_VAL_IN[63:32]	RO	X	Input values of GPIO 63 – 32
31:0	GPIO_VAL_OUT[63:32]	WO	0	Output values of GPIO 63 – 32

Table 5.39 - GPIO 32 – 63 Value Register

#### 5.2.10.3 GPIO 64 – 66 Value Register (address offset: 0x8C)

Bit	Name	Type	Default Value	Description
31:3	Reserved	-	-	-
2:0	GPIO_VAL_IN[66:64]	RO	X	Input values of GPIO 66 – 64
2:0	GPIO_VAL_OUT[66:64]	WO	0	Output values of GPIO 66 – 64

Table 5.40 - GPIO 64 – 66 Value Register

### 5.2.11 GPIO Interrupt Enable Registers (address offset: 0x90 – 0x9B)

When a pin has been configured as an input with interrupt capability, the GPIO Interrupt Enable Register can be used to enable interrupt generation. Each register enables interrupt generation for 32 digital pins except the last register, which only enables interrupt generation for 3 pins (64 to 66). Each bit of the register enables interrupt generation for 1 digital pin.

**These should be used only for pads that have been properly configured as interrupt enabled GPIO inputs.**

#### 5.2.11.1 GPIO 00 – 31 Interrupt Enable Register (address offset: 0x90)

Bit	Name	Type	Default Value	Description
31:0	GPIO_INT_EN[31:0]	RW	0	GPIO input 31-0 interrupt enable when set.

Table 5.41 - GPIO 00 – 31 Interrupt Enable Register

#### 5.2.11.2 GPIO 32 – 63 Interrupt Enable Register (address offset: 0x94)

Bit	Name	Type	Default Value	Description
31:0	GPIO_INT_EN[63:32]	RW	0	GPIO input 63-32 interrupt enable when set.

Table 5.42 - GPIO 32 – 63 Interrupt Enable Register

#### 5.2.11.3 GPIO 64 – 66 Interrupt Enable Register (address offset: 0x98)

Bit	Name	Type	Default Value	Description
31:3	Reserved	-	-	-
2:0	GPIO_INT_EN[66:64]	RW	0	GPIO input 66-64 interrupt enable when set.

Table 5.43 - GPIO 64 – 66 Interrupt Enable Register

### 5.2.12 Interrupt Pending Registers (address offset: 0x9C – 0xA7)

These registers hold the interrupt pending flags for the GPIO pins. Each register holds the flags for 32 digital pins except the last register, which only holds the flags for 3 pins (64 to 66). Each bit of the register holds the flag for 1 digital pin.

#### 5.2.12.1 GPIO 00 – 31 Interrupt Pending Register (address offset: 0x9C)

Bit	Name	Type	Default Value	Description
31:0	GPIO_INT_PEND[31:0]	RW1C	0	GPIO input 31-0 interrupt pending when set; write a 1 to clear.

**Table 5.44 - GPIO 00 – 31 Interrupt Pending Register**

#### 5.2.12.2 GPIO 32 – 63 Interrupt Pending Register (address offset: 0xA0)

Bit	Name	Type	Default Value	Description
31:0	GPIO_INT_PEND[63:32]	RW1C	0	GPIO input 63-32 interrupt pending when set; write a 1 to clear.

**Table 5.45 - GPIO 32 – 63 Interrupt Pending Register**

#### 5.2.12.3 GPIO 64 – 66 Interrupt Pending Register (address offset: 0xA4)

Bit	Name	Type	Default Value	Description
31:3	Reserved	-	-	-
2:0	GPIO_INT_PEND[66:64]	RW1C	0	GPIO input 66-64 interrupt pending when set; write a 1 to clear.

**Table 5.46 - GPIO 64 – 66 Interrupt Pending Register**

### 5.2.13 ETH\_PHY\_CFG - Ethernet PHY Miscellaneous Configuration Register (address offset: 0xA8)

Bit	Name	Type	Default Value	Description
31:23	Reserved	-	-	-
22:20	ETHERNET_LED1_SEL	RW	0	Ethernet LED 1 source selection: 0: LINKLED 1: TXLED 2: RXLED 3: COLLED 4: FDXLED Others: SPDLED
19	Reserved	-	-	-
18:16	ETHERNET_LED2_SEL	RW	3'h7	Ethernet LED 2 source selection: 0: LINKLED 1: TXLED 2: RXLED 3: COLLED 4: FDXLED Others: SPDLED
15:11	Reserved	-	-	-
10	ETHERNET_LOOPBACK	RW	0	0: Normal operation 1: Ethernet loopback
9	ETHERNET_PWRSV	RW	1	1: Ethernet PHY Power Save (Preferably Set this to 0 prior to enabling the MAC clock)
8	ETHERNET_PWRDN	RW	1	1: Ethernet PHY Power Down (Preferably Set this to 0 prior to enabling the MAC clock)

				MAC clock)
7:5	Reserved	-	-	-
4:0	ETHERNET_PHYAD	RW	0	Ethernet PHY Address

**Table 5.47 - ETH\_PHY\_CFG - Ethernet PHY Miscellaneous Configuration Register**

#### 5.2.14 ETH\_PHY\_ID - Ethernet PHY ID Register (address offset: 0xAC)

Bit	Name	Type	Default Value	Description
31:0	ETHERNET_PHYID	RW	0	Ethernet PHY ID

**Table 5.48 - ETH\_PHY\_ID - Ethernet PHY ID Register**

#### 5.2.15 DAC\_ADC\_CONF - ADC/DAC Configuration/Status Register (address offset: 0xB0)

Bit	Name	Type	Default Value	Description
31:27	Reserved	-	-	-
26	ADC_IRQ_PEND	RW1C	0	ADC Interrupt Pending when set. Write a 1 to clear this bit.
25	DAC_IRQ_PEND1	RW1C	0	DAC 1 Interrupt Pending when set. Write a 1 to clear this bit.
24	DAC_IRQ_PEND0	RW1C	0	DAC 0 Interrupt Pending when set. Write a 1 to clear this bit.
23:19	Reserved	-	-	-
18	ADC_IRQ_EN	RW	0	1: Enable ADC interrupt
17	DAC_IRQ_EN1	RW	0	1: Enable DAC 1 interrupt
16	DAC_IRQ_EN0	RW	0	1: Enable DAC 0 interrupt
15	ADC_START	RWAC	0	Write 1 to start ADC operations. This bit will be automatically cleared if ADC_CONT is 0; otherwise, if ADC_CONT, ADC operation runs till this is set to 0 by the user.
14	ADC_EXTEND	RW	0	(Internal use only): Normal conversion takes 13 cycles; setting this bit to 1 will make the conversion take 14 cycles.
13	ADC_EXT_VREF	RW	0	1: Enable Rail-Rail Reference. The range is 0 - 3.3V. 0: Disable Rail-Rail Reference. The range is 0.33 - 2.97V.
12	ADC_CONT	RW	0	1: Enable ADC continuous mode; ADC samples are available in the ADC FIFO after conversion
11	ADC_PDB	RW	0	0: power down ADC Set to 0 if ADC Is not used in the chip configuration.
10:8	ADC_CHANNEL	RW	0	0: No channel is selected 1: Channel 0 selected 2: Channel 1 selected 3: Channel 2 selected 4: Channel 3 selected 5: Channel 4 selected

Bit	Name	Type	Default Value	Description
				6: Channel 5 selected 7: Channel 6 selected
7	DAC_START1	RW	0	Write 1 to start DAC 0 conversion. When DAC_CONT1 is not set, this bit is automatically cleared after a single conversion. When DAC_CONT1 is set, conversion proceeds (samples are taken from FIFO) until this bit is cleared by software.
6	Reserved	-	-	-
5	DAC_CONT1	RW	0	1: Enable DAC 1 continuous conversion mode; DAC samples are read from the DAC FIFO
4	DAC_PDB1	RW	0	0: Power down DAC 1. Set to 0 if DAC 1 is not used in the chip configuration. 1: Normal operation for DAC 1.
3	DAC_START0	RWAC	0	Write 1 to start DAC 0 conversion. When DAC_CONT0 is not set, this bit is automatically cleared after a single conversion. When DAC_CONT0 is set, conversion proceeds (samples are taken from FIFO) until this bit is cleared by software.
2	Reserved	-	-	-
1	DAC_CONT0	RW	0	1: Enable DAC0 in continuous conversion mode; DAC samples are read from the DAC FIFO
0	DAC_PDB0	RW	0	0: Power down DAC 0. Set to 0 if DAC 0 Is not used in the chip configuration. 1: Normal operation for DAC 0.

**Table 5.49 - DAC\_ADC\_CONF - ADC/DAC Configuration/Status Register**

#### 5.2.16 DAC\_ADC\_CNT - ADC/DAC Count Register (address offset: 0xB4)

Bit	Name	Type	Default Value	Description
31	Reserved	-	-	-
30:24	DAC_DIVIDER	RW	7'h63	This determines the DAC1/0 conversion rate. The rate is determined by Peripheral clock freq / (DAC_DIVIDER+1) The maximum conversion rate is 1MHz.
23:16	ADC_DATA_COUNT	RO	0	The amount of data available for reading in the ADC FIFO at the most recent interrupt. The FIFO contains at least ADC_DATA_COUNT samples for readout
15:8	DAC_DATA_COUNT1	RO	0	The amount of data still available for conversion in the DAC 1 FIFO. The FIFO contains at most DAC_DATA_COUNT1 samples for conversion
7:0	DAC_DATA_COUNT0	RO	0	The amount of data still available for

Bit	Name	Type	Default Value	Description
				conversion in the DAC 0 FIFO. The FIFO contains at most DAC_DATA_COUNT0 samples for conversion

**Table 5.50 - DAC\_ADC\_CNT - ADC/DAC Count Register**

#### 5.2.17 DAC\_ADC\_DATA - ADC/DAC Data Register (address offset: 0xB8)

Bit	Name	Type	Default Value	Description
31:26	Reserved	RO	0	
25:16	DAC_DATA1	WO	0	DAC 1 Data write window for DAC 1 FIFO; If byte access is used, write to the FIFO occurs only when the high byte is written. Hence the upper bits should be written last in this case.
15:10	Reserved	RO	0	
9:0	ADC_DATA	RO	0	ADC Data read window from FIFO for ADC. Only 16-bit read accesses are supported.
9:0	DAC_DATA0	WO	0	DAC 0 Data write window for DAC 1 FIFO; If byte access is used, write to the FIFO occurs only when the high byte is written. Hence the upper bits should be written last in this case.

**Table 5.51 - DAC\_ADC\_DATA - ADC/DAC Data Register**

## 6 Interrupt Controller

The interrupt controller takes in 32 interrupts, and based on the interrupt priorities assigned generates the interrupt to the FT900 together with an ISR address. Nested interrupts are allowed if enabled. By default, it is disabled. Up to 16 levels of nesting is allowed which defaults to only 1 level if nesting is enabled.

When nesting is enabled, only interrupts with higher priorities can interrupt the current interrupt. Interrupts of same or lower priorities will be queued as long as the interrupt sources are not cleared.

The ISR vectors range from 0 to 31, corresponding to interrupts 0 to 31. The actual ISR address corresponds to program memory addresses 2 to 33.

The highest priority interrupt by default is interrupt input 0, and the lowest interrupt input is 31. The priorities however can be rearranged by setting the appropriate registers. Each interrupt input is assigned an interrupt priority position that can be changed. Note it's possible to assign multiple interrupts to the same priority. By default, the interrupts 0 to 31 are assigned interrupt priorities 0 to 31 respectively, with lower number indicating higher priority.

**A global interrupt mask bit is also available. Setting it to 1 will temporarily block all interrupts except the interrupt assigned as interrupt 0 which is non-maskable by this global mask.**

In the FT900, the interrupts connections from the peripherals are listed in the table below. Interrupts 23 to 31 are unused by default.

Peripheral Interrupt	Interrupt Controller Interrupt Input Number	Default Priority
Power Management	0	0 (Highest) – Non-maskable
USB Host	1	1
USB Peripheral	2	2
Ethernet	3	3
SD Host	4	4
CAN 0	5	5
CAN 1	6	6
Data Capture Interface	7	7
SPI Master	8	8
SPI Slave 0	9	9
SPI Slave 1	10	10
I2C Master	11	11
I2C Slave	12	12
UART 0	13	13
UART 1	14	14
I2S	15	15
PWM	16	16
TIMERS	17	17
GPIO	18	18
RTC	19	19
ADC	20	20
DAC	21	21
SLOWCLOCK Timer	22	22
<b>UNUSED</b>	<b>23-31</b>	<b>23-31</b>

**Table 6.1 - Interrupt Assignment Table**

### 6.1 Register Summary

The base address for the interrupt assignment registers is 0x100C0. All registers and RAM locations can be accessed via Byte (8-bit), Word (16-bit) or Double-Word (32-bit) mode.

Address Offset	Register	Default Value	References

**Table 6.2 - Overview of Interrupt Control Registers**

## 6.2 Register Details

### 6.2.1 IRQ00-03 Assignment Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR03ASSIGN	RW	5'h03	Priority assignment for interrupt 3
23:21	Reserved	-	-	-
20:16	PR02ASSIGN	RW	5'h02	Priority assignment for interrupt 2
15:13	Reserved	-	-	-
12:8	PR01ASSIGN	RW	5'h01	Priority assignment for interrupt 1
7:5	Reserved	-	-	-
4:0	PR00ASSIGN	RW	5'h00	Priority assignment for interrupt 0

**Table 6.3 - IRQ00-03 Assignment Register**

### 6.2.2 IRQ04-07 Assignment Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR07ASSIGN	RW	5'h07	Priority assignment for interrupt 7
23:21	Reserved	-	-	-
20:16	PR06ASSIGN	RW	5'h06	Priority assignment for interrupt 6
15:13	Reserved	-	-	-
12:8	PR05ASSIGN	RW	5'h05	Priority assignment for interrupt 5
7:5	Reserved	-	-	-
4:0	PR04ASSIGN	RW	5'h04	Priority assignment for interrupt 4

**Table 6.4 - IRQ04-07 Assignment Register**

### 6.2.3 IRQ08-11 Assignment Register (address offset: 0x08)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR11ASSIGN	RW	5'h0B	Priority assignment for interrupt 11
23:21	Reserved	-	-	-

20:16	PR10ASSIGN	RW	5'h0A	Priority assignment for interrupt 10
15:13	Reserved	-	-	-
12:8	PR09ASSIGN	RW	5'h09	Priority assignment for interrupt 9
7:5	Reserved	-	-	-
4:0	PR08ASSIGN	RW	5'h08	Priority assignment for interrupt 8

**Table 6.5 - IRQ08-11 Assignment Register**

#### 6.2.4 IRQ12-15 Assignment Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR15ASSIGN	RW	5'h0F	Priority assignment for interrupt 15
23:21	Reserved	-	-	-
20:16	PR14ASSIGN	RW	5'h0E	Priority assignment for interrupt 14
15:13	Reserved	-	-	-
12:8	PR13ASSIGN	RW	5'h0D	Priority assignment for interrupt 13
7:5	Reserved	-	-	-
4:0	PR12ASSIGN	RW	5'h0C	Priority assignment for interrupt 12

**Table 6.6 - IRQ12-15 Assignment Register**

#### 6.2.5 IRQ16-19 Assignment Register (address offset: 0x10)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR19ASSIGN	RW	5'h13	Priority assignment for interrupt 19
23:21	Reserved	-	-	-
20:16	PR18ASSIGN	RW	5'h12	Priority assignment for interrupt 18
15:13	Reserved	-	-	-
12:8	PR17ASSIGN	RW	5'h11	Priority assignment for interrupt 17
7:5	Reserved	-	-	-
4:0	PR16ASSIGN	RW	5'h10	Priority assignment for interrupt 16

**Table 6.7 - IRQ16-19 Assignment Register**

#### 6.2.6 IRQ20-23 Assignment Register (address offset: 0x14)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR23ASSIGN	RW	5'h17	Priority assignment for interrupt 23
23:21	Reserved	-	-	-
20:16	PR22ASSIGN	RW	5'h16	Priority assignment for interrupt 22
15:13	Reserved	-	-	-
12:8	PR21ASSIGN	RW	5'h15	Priority assignment for interrupt 21
7:5	Reserved	-	-	-
4:0	PR20ASSIGN	RW	5'h14	Priority assignment for interrupt 20

**Table 6.8 - IRQ20-23 Assignment Register**

#### 6.2.7 IRQ24-27 Assignment Register (address offset: 0x18)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR27ASSIGN	RW	5'h1B	Priority assignment for interrupt 27
23:21	Reserved	-	-	-

20:16	PR26ASSIGN	RW	5'h1A	Priority assignment for interrupt 26
15:13	Reserved	-	-	-
12:8	PR25ASSIGN	RW	5'h19	Priority assignment for interrupt 25
7:5	Reserved	-	-	-
4:0	PR24ASSIGN	RW	5'h18	Priority assignment for interrupt 24

**Table 6.9 - IRQ24-27 Assignment Register**

#### 6.2.8 IRQ28-31 Assignment Register (address offset: 0x1C)

Bit	Name	Type	Default Value	Description
31:29	Reserved	-	-	-
28:24	PR31ASSIGN	RW	5'h1F	Priority assignment for interrupt 31
23:21	Reserved	-	-	-
20:16	PR30ASSIGN	RW	5'h1E	Priority assignment for interrupt 30
15:13	Reserved	-	-	-
12:8	PR29ASSIGN	RW	5'h1D	Priority assignment for interrupt 29
7:5	Reserved	-	-	-
4:0	PR28ASSIGN	RW	5'h1C	Priority assignment for interrupt 28

**Table 6.10 - IRQ28-31 Assignment Register**

#### 6.2.9 IRQ Control Register (address offset: 0x20)

Bit	Name	Type	Default Value	Description
31	Global Interrupt Mask	RW	1	Set to 1 to mask all interrupts.
30:8	Reserved	-	-	-
7	Nested Interrupt	RW	0	Set to 1 to enable nested interrupts. This bit shall be set or cleared while the Global Interrupt Mask is enabled.
6:4	Reserved	-	-	-
3:0	Nested Depth	RW	4'h00	Maximum number of nested interrupts permitted (Nested Depth + 1); minimum 1 level, and maximum 16 levels.

**Table 6.11 - IRQ Control Register**

## 7 EFUSE

### 7.1 Introduction

The EFUSE is the only way to modify the content of the [Chip Configuration Register](#).

There are 64 bits in the EFUSE, in which the lower 32 bits correspond to the 32 bits in the register. Please note that only bits 27..0 should be modified by the EFUSE operation described below.

The EFUSE can be accessed externally via the first SPI slave interface (SPI Slave 1) while RESET is active. The supported mode is CPOL = 0 and CPHA = 0.

For the data transfer, a read operation reads all EFUSE bits at a time while a write operation writes each individual EFUSE bit separately.

**Warning:** *Each EFUSE bit can only be written (or blown) once. After the bit has been blown, there is no way to revert it.*

### 7.2 EFUSE Operation

To use the interface to access the EFUSE, send in "EFU" as the first 3 bytes.

To read from the EFUSE, send in the command 0x80. 8 dummy clocks are needed to perform the EFUSE read; another 64 dummy clocks must be provided to shift out the 64-bit EFUSE contents, with the MSB first.

To write to the EFUSE, send in the command 0x08, followed by 8-bit address (only the lower 6 bits are effective). A dummy byte should follow that.

After the required programming period (~500us) has elapsed, a non-zero byte should be sent in to terminate the programming cycle. The programming will not terminate automatically. CS signal shall remain asserted throughout until the last termination byte is transmitted.

### 7.3 EFUSE bits

The table below shows the 64 bits. The bit number acts as the bit address for the write operation.

Bit	Name	Description
27	1-Wire_ACTIVE	If set, one-wire debug interface is available; otherwise, it's permanently disabled.
26	EXT_SPI_ACTIVE	If set, internal FLASH/EFUSE can be accessed via SPI Slave 1 interface during reset; otherwise, this interface is permanently disabled.
25:21	Reserved	-
20	FLASH_RD_ENA	If set, FLASH read via the external SPI interface is allowed; otherwise, this feature is permanently disabled. Write will still be available; but see bits 19-16
19	FLASH_WR_B3_ENA	If set, FLASH write/erase to bytes 196608 – 262143 is allowed; otherwise, it is permanently non-writable/non-erasable.
18	FLASH_WR_B2_ENA	If set, FLASH write/erase to bytes 131072 – 196607 is allowed; otherwise, it is permanently non-writable/non-erasable.
17	FLASH_WR_B1_ENA	If set, FLASH write/erase to bytes 65536 – 131071 is allowed; otherwise, it is permanently non-writable/non-erasable.
16	FLASH_WR_B0_ENA	If set, FLASH write/erase to bytes 0 – 65535 is allowed; otherwise, it is permanently non-writable/non-erasable.

Bit	Name	Description
15:0	FLASH_CODE_RD	<p>Each bit corresponds 16kB of FLASH location, with bit 0 referring to locations 0-16383.</p> <p>When set the data residing in the said FLASH locations are not considered as sensitive information and when copied to the program memory, user program may access these via LPM/LPMI instructions.</p> <p>When cleared, the data are considered as sensitive information and reading them via LPM/LPMI instructions will not return the correct content.</p>

**Table 7.1 - EFUSE Bits**

## 8 USB Host

This is a single -port USB host controller which is compliant with the USB 2.0 specification and compatible with the Enhanced Host Controller Interface (EHCI) specification. It supports HS/FS/LS transactions, control/bulk/interrupt/isochronous transfers and split-transaction of the hub. An 8 kB RAM arranged as (2 kB x 32) is attached to the host as buffers.

### 8.1 Register Summary

Listed below are the registers with their offset from the base address (0x10100). All registers and RAM locations can be accessed via Byte (8-bit), Word (16-bit) or Double-Word (32-bit) mode.

Address Offset	Register	Default Value	References
<b>EHCI Operational Registers</b>

**Table 8.1 - Overview of USB Host Controller Registers**

## 8.2 EHCI Operational Registers

### 8.2.1 HC Capability Register (address offset: 0x00)

This register has information on the host controller interface specification number implemented in this host controller.

Bit	Name	Type	Default Value	Description
31:16	HCIVERSION	RO	16'h0100	Host Controller Interface Version Number It is a 2-byte register containing a BCD encoding of the EHCI revision number supported by the host controller
15:8	Reserved	-	-	-
7:0	CAPLENGTH	RO	8'h10	Capability Register Length It is used as an offset added to the register base to find out the beginning of the Operational Register Space

**Table 8.2 - HC Capability Register**

### 8.2.2 HCSPARAMS – HC Structural Parameters (address offset: 0x04)

This register specifies the number of downstream ports implemented in this host controller.

Bit	Name	Type	Default Value	Description
31:4	Reserved	-	-	-
3:0	N_PORTS	RO	4'h1	Number of Ports This specifies the number of the physical downstream ports implemented on the host controller

**Table 8.3 - HCSPARAMS – HC Structural Parameters**

### 8.2.3 HCCPARAMS – HC Capability Parameters (address offset: 0x08)

Bit	Name	Type	Default Value	Description
31:3	Reserved	-	-	-
2	ASYN_SCH_PARK_CAP	RO	1'b1	Asynchronous Schedule Park Capability The host controller supports the park feature for HS queue heads in the Asynchronous Schedule. This feature can be disabled or enabled and set to a specific level by using the <i>Asynchronous Schedule Park Mode Enable</i> and <i>Asynchronous Schedule Park Mode Count</i> fields in the USBCMD register
1	PROG_FR_LIST_FLAG	RO	1'b1	Programmable Frame List Flag

Bit	Name	Type	Default Value	Description
				When this bit is set to 1, the system software can specify and use a smaller frame list and configure the host controller via Frame List Size field of the USBCMD register. This requirement ensures that the frame list is always physically contiguous.
0	Reserved	-	-	-

**Table 8.4 - HCCPARAMS – HC Capability Parameters**

#### 8.2.4 USBCMD – HC USB Command Register (address offset: 0x10)

The command register is used by the software to schedule the command to be executed by the USB host controller hardware.

Bit	Name	Type	Default Value	Description
31:24	Reserved	-	-	-
23:16	INT_THRC	RW	8'h08	<p>Interrupt Threshold Control            This is used by the system software to select the maximum rate at which the host controller will issue the interrupts. The only valid values are as below:            0x00: Reserved            0x01: 1 micro-frame (125us)            0x02: 2 micro-frames (250us)            0x04: 4 micro-frames (500us)            0x08: 8 micro-frames (default: 1ms)            0x10: 16 micro-frames (2ms)            0x20: 32 micro-frames (4ms)            0x40: 64 micro-frames (8ms)</p> <p><b>Note:</b> In the FS mode, these bits are reserved.</p>
15:12	Reserved	-	-	-
11	ASYN_PK_EN	RW	1'b1	Asynchronous Schedule Park Mode Enable Software uses this to enable or disable the Park mode. When this is set to 1, the Park mode is enabled
10	Reserved	-	-	-
9:8	ASYN_PK_CNT	RW	2'h3	Asynchronous Schedule Park Mode Count This contains a count for the number of successive transactions that the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule.
7	Reserved	-	-	-
6	INT_OAAD	RW	1'b0	Interrupt on Asynchronous Advance Doorbell This is used as a doorbell by software to ring the host controller to issue and interrupt at the next advance of the synchronous schedule.
5	ASCH_EN	RW	1'b0	Asynchronous Schedule Enable

Bit	Name	Type	Default Value	Description
				This controls whether the host controller skips the processing of asynchronous schedule. 0: Do not process the asynchronous schedule 1: Use the ASYNCLISTADDR register to access the asynchronous schedule
4	PSCH_EN	RW	1'b0	Periodic Schedule Enable This controls whether the host controller skips the processing of the period schedule. 0: Do not process the period schedule 1: Use the PERIODICLISTBASE register to access the period schedule
3:2	FRL_SIZE	RW	2'h0	Frame List Size This specifies the size of the frame list. 00: 1024 elements (default value, 4096 bytes) 01: 512 elements (2048 bytes) 10: 256 elements (1024 bytes) 11: reserved
1	HC_RESET	RW	1'b0	Host Controller Reset This is used by the software to reset the host controller.
0	RS	RW	1'b0	Run/Stop When this is set to 1, the host controller proceeds with the execution of schedule. 0: Stop 1: Run

**Table 8.5 - USBCMD – HC USB Command Register**

### 8.2.5 USBSTS – HC USB Status Register (address offset: 0x14)

This register indicates the status of the USB host controller. This register is updated by the USB host controller hardware. Software clears a bit by writing 1 to the bit.

Bit	Name	Type	Default Value	Description
31:16	Reserved	-	-	-
15	ASCH_STS	RO	1'b0	Asynchronous Schedule Status This reports the actual status of the asynchronous schedule.
14	PSCH_STS	RO	1'b0	Periodic Schedule Status This reports the actual status of the periodic schedule.
13	Reclamation	RO	1'b0	Reclamation This is a read-only status bit, and used to detect an empty of the asynchronous schedule
12	HCHalted	RO	1'b1	Host Controller Halted This is a 0 whenever the Run/Stop bit is set to 1. The host controller sets this to 1 after it has stopped the section as a result of the Run/Stop bit being set to 0.
11:6	Reserved	-	-	-

Bit	Name	Type	Default Value	Description
5	INT_OAA	RW1C	1'b0	Interrupt on Async Advance This bit indicates the assertion of interrupt on <i>Async Advance Doorbell</i>
4	H_SYSERR	RW1C	1'b0	Host System Error The host controller sets this to 1 when a serious error occurs during a host system access involving the host controller module.
3	FRL_ROL	RW1C	1'b0	Frame List Rollover The host controller sets this to 1 when the <i>Frame List Index</i> rolls over from its maximum value to zero.
2	PO_CHG_DET	RW1C	1'b0	Port Change Detect The host controller sets this to 1 when any port has a change bit transition from 0 to 1. In addition, this bit is loaded with the OR of all of the PORTSC change bits.
1	USBERR_INT	RW1C	1'b0	USB Error Interrupt The host controller sets this to 1 when the completion of a USB transaction results in an error condition
0	USB_INT	RW1C	1'b0	USB Interrupt The host controller sets this to 1 upon completion of a USB transaction

**Table 8.6 - USBSTS – HC USB Status Register**

#### 8.2.6 USBINTR – HC USB Interrupt Enable Register (address offset: 0x18)

This register enables the required host controller interrupts. The interrupts enabled by this register toggle the interrupt pin when the interrupt condition occurs. Interrupts not enabled in this register do not toggle the interrupt pin but the status can be read by polling the interrupt status register.

Bit	Name	Type	Default Value	Description
31:6	Reserved	-	-	-
5	INT_OAA_EN	RW	1'b0	Interrupt on Async Advance Enable When this is 1 and the <i>Interrupt on Async Advance</i> bit in the USBSTS register is 1, the host controller will issue an interrupt at the next interrupt threshold.
4	H_SYSERR_EN	RW	1'b0	Host System Error Enable When this is 1 and the <i>Host System Error Status</i> bit in the USBSTS register is 1, the host controller will issue an interrupt at the next interrupt threshold.
3	FRL_ROL_EN	RW	1'b0	Frame List Rollover Enable When this is 1 and the <i>Frame List Rollover</i> bit in the USBSTS register is 1, the host controller will issue an interrupt at the next interrupt threshold.
2	PO_CHG_INT_EN	RW	1'b0	Port Change Interrupt Enable When this is 1 and the <i>Port Change Detect</i> bit in the USBSTS register is 1, the host

Bit	Name	Type	Default Value	Description
				controller will issue an interrupt at the next interrupt threshold.
1	USBERR_INT_EN	RW	1'b0	USB Error Interrupt Enable When this is 1 and the <i>USBERRINT</i> bit in the USBSTS register is 1, the host controller will issue an interrupt at the next interrupt threshold.
0	USB_INT_EN	RW	1'b0	USB Interrupt Enable When this is 1 and the <i>Host USBINT</i> bit in the USBSTS register is 1, the host controller will issue an interrupt at the next interrupt threshold.

**Table 8.7 - USBINTR – HC USB Interrupt Enable Register**

#### 8.2.7 FRINDEX – HC Frame Index Register (address offset: 0x1C)

This register is used by the host controller to index the periodic frame. The register is updated every 125 microseconds.

Bit	Name	Type	Default Value	Description
31:14	Reserved	-	-	-
13:0	FRINDEX	RW	14'h0000	Frame Index This is used by the host controller to index the frame into the Periodic Frame List. It is updated every 125us. It cannot be written unless the host controller is halted.

**Table 8.8 - FRINDEX – HC Frame Index Register**

#### 8.2.8 PERIODICLISTBASE – HC Periodic Frame List Base Address Register (address offset: 0x24)

This register contains the beginning address of the periodic frame list in the system memory.

Bit	Name	Type	Default Value	Description
31:12	PERI_BASE_ADR	RW	Undefined	Periodic Frame List Base Address This 32-bit register contains the start address of the Periodic Frame List in the system memory. These form the upper 20 bits of the address.
11:0	Reserved	-	-	-

**Table 8.9 - PERIODICLISTBASE – HC Periodic Frame List Base Address Register**

#### 8.2.9 ASYNCLISTADDR – HC Current Asynchronous List Address Register (address offset: 0x28)

This register contains the address of the next asynchronous queue head to be executed.

Bit	Name	Type	Default Value	Description
31:5	ASYNC_LADR	RW	Undefined	Current Asynchronous List Address This 32-bit register contains the address of

				the next asynchronous queue head to be executed. These form the upper 27 bits of the address.
4:0	Reserved	-	-	-

**Table 8.10 - ASYNCLISTADDR – HC Current Asynchronous List Address Register**

### 8.2.10 PORTSC – HC Port Status and Control Register (address offset: 0x30)

This register is reset only by hardware when the power is initially applied or in response to a host controller reset.

Bit	Name	Type	Default Value	Description								
31:17	Reserved	-	-	-								
16	TST_FORCEEN	RW	1'b0	<p>Test Force Enable          When this is 1 the downstream facing port will be enabled in the high-speed mode. ### 8.3.3 HPROT – Master Protection Information Setting Register (address offset: 0x78)

Bit	Name	Type	Default Value	Description
31:4	Reserved	-	-	-
3:0	HPROT	RW	4'h3	Master Protection Information For programmable HPROT, software can use this to implement some level of protection.

**Table 8.14 - HPROT – Master Protection Information Setting Register**

## 8.4 USB Host Testing Registers

### 8.4.1 Vendor Specific IO Control Register (address offset: 0x54)

Bit	Name	Type	Default Value	Description
31:6	Reserved	-	-	-
5	VCTLOAD_N	RW	1'b1	Vendor-Specific Test Mode Control Load This controls the active low output U_VCTLOAD_N to the PHY. Setting this to 1 makes U_VCTLOAD_N output a 1. Setting this to 0 makes U_VCTLOAD_N output a 0.
4:0	VCTL	RW	5'h00	Vendor-Specific Test Mode Control The programmed value is delivered to the PHY via the U_VCTL output.

**Table 8.15 - Vendor Specific IO Control Register**

### 8.4.2 Vendor Specific Status Register (address offset: 0x58)

Bit	Name	Type	Default Value	Description
31:0	Reserved	-	-	Vendor-Specific Test Mode Status

**Table 8.16 - Vendor Specific Status Register**

### 8.4.3 Test Register (address offset: 0x50)

Bit	Name	Type	Default Value	Description
31:5	Reserved	-	-	-
4	TST_LOOPBK	RW	1'b0	FIFO Loop Back Mode When this is set to 1, the host controller will enter the loop-back mode.
3	TST_MOD	RW	1'b0	Test Mode When this is set to 1, the host controller will enter the test mode. This test mode can save the simulation time. In the normal mode, the host controller uses a counter for 10ms detection of the USB reset. This is reduced in test mode.
2	TST_PKT	RW	1'b0	Test Packet Upon entering HS mode and setting this bit to 1, the test packet data defined in the USB specification has to be written. The host controller will repeatedly send the packet defined in the UTMI specification to the transceiver.
1	TST_KSTA	RW	1'b0	When this is set to 1, D+/D- are set to HS K state.
0	TST_JSTA	RW	1'b0	When this is set to 1, D+/D- are set to HS J state.

**Table 8.17 - Test Register**

Bit	Name	Type	Default Value	Description
31:0	Reserved	-	-	-

**Table 8.19 - HC\_RSRV2 - Reserved 2 Register**

## 9 USB Peripheral

This is a USB device controller fully compliant with the USB 2.0 specification. It supports a control end point - End Point 0 (EP0) - and up to 7 other End Points (EP1-7).

The EP0 control endpoint buffer size ranges from 8 to 64 bytes, configurable via software. EP1-7 support optional double buffering. The number of end points supported can be set by software, as well as their individual direction, type (Interrupt, Bulk, and Isochronous) and buffer size (8-1024 bytes). The total buffer size to be shared by all end points is 4 kB.

### 9.1 Register Summary

Listed below are the registers with their offset from the base address (0x10180). All registers and buffer locations can only be accessed via Byte (8-bit) mode.

**Table 9.1 - Overview of USB Peripheral Registers**

## 9.2 Initialization Registers

### 9.2.1 DC\_ADDRESS\_ENABLE – Address Register (address offset: 0x18)

This register sets the USB assigned address sent from the USB host and enables the USB peripheral. In response to the standard USB request SET\_ADDRESS, the firmware must write the peripheral address to this register.

Bit	Name	Type	Default Value	Description
7	ENABLE	RO	1'b0	Hardware sets this to 1 when software writes a new address to this register. It is cleared by hardware at the end of the current transfer when the new address will take effect.
6:0	ADDR	RW	7'h00	Function Address

**Table 9.2 - DC\_ADDRESS\_ENABLE – Address Register**

### 9.2.2 DC\_MODE – Mode Register (address offset: 0x10)

This register allows the firmware to select the different test modes and enables the USB peripheral function.

Bit	Name	Type	Default Value	Description
7	TST_MODE_ENABLE	RW	1'b0	Test Mode Enable. Setting this to 1 to enter the test mode. It can only be cleared by hardware reset.
6:5	TST_MODE_SELECT	RW	2'h0	Test Mode select (writeable only if MODE_ENABLE is 0) 2'h0: SE0_NAK 2'h1: J 2'h2: K 2'h3: Packet
4:2	Reserved	-	-	-
1	FS_ONLY	RW	1'b0	Setting this to 1 disables HS detection handshake

0	USB_DEV_EN	RW	1'b0	USB function enables. Setting this to 1 enables the USB device
---	------------	----	------	--

**Table 9.3 - DC\_MODE – Mode Register**

#### 9.2.3 DC\_INT\_ENABLE – Interrupt Enable Register (address offset: 0x08)

This register enables the different interrupt sources by writing a 1 to the corresponding bit.

Bit	Name	Type	Default Value	Description
7	PHY_IE	RW	1'b0	PHY receive error interrupt enable
6	PID_IE	RW	1'b0	Package ID error interrupt enable
5	CRC16_IE	RW	1'b0	CRC16 error interrupt enable
4	CRC5_IE	RW	1'b0	CRC5 error interrupt enable
3	RESM_IE	RW	1'b0	Resume interrupt enable
2	SUS_IE	RW	1'b0	Suspend interrupt enable
1	RST_IE	RW	1'b0	Reset interrupt enable
0	SOF_IE	RW	1'b0	Start of Frame interrupt enable

**Table 9.4 - DC\_INT\_ENABLE – Interrupt Enable Register**

#### 9.2.4 DC\_EP\_INT\_ENABLE – Endpoints Interrupt Enable Register (address offset: 0x0C)

This register enables the different interrupt sources based on the specific endpoints by writing 1 to the corresponding bit.

Bit	Name	Type	Default Value	Description
7	EP7_IE	RW	1'b0	Endpoint 7 interrupt enable
6	EP6_IE	RW	1'b0	Endpoint 6 interrupt enable
5	EP5_IE	RW	1'b0	Endpoint 5 interrupt enable
4	EP4_IE	RW	1'b0	Endpoint 4 interrupt enable
3	EP3_IE	RW	1'b0	Endpoint 3 interrupt enable
2	EP2_IE	RW	1'b0	Endpoint 2 interrupt enable
1	EP1_IE	RW	1'b0	Endpoint 1 interrupt enable
0	EP0_IE	RW	1'b0	Endpoint 0 interrupt enable

**Table 9.5 - DC\_EP\_INT\_ENABLE – Endpoints Interrupt Enable Register**

## 9.3 Control Endpoint Data Flow Registers

Control Endpoint Data flow registers are used for configuring the control endpoint and handle the sending and receiving data to the control endpoint.

#### 9.3.1 DC\_EP0\_CONTROL – Endpoint 0 Control Register (address offset: 0x1C)

This register configures the maximum packet size of the control endpoint 0. It is also used to stall the control endpoint.

Bit	Name	Type	Default Value	Description
7:3	Reserved	-	-	-
2:1	EP_SIZE	RW	2'h0	Endpoint Maximum packet size 2'h0: 8 bytes 2'h1: 16 bytes 2'h2: 32 bytes 2'h3: 64 bytes
0	STALL	RW	1'b0	Send STALL Software writes 1 to send a STALL handshake in response to an IN token. Software writes 0 to terminate the STALL signalling.

**Table 9.6 - DC\_EP0\_CONTROL – Endpoint 0 Control Register**

### 9.3.2 DC\_EP0\_STATUS – Endpoint 0 Status Register (address offset: 0x20)

This register is used by the hardware to report the status of the control endpoint 0. Software writes 1 to the corresponding register bit to clear the status.

Bit	Name	Type	Default Value	Description
7:5	Reserved	-	-	-
4	DATA-END	RW1S	1'b0	Data End. Software should update this bit to 1 when writing: <ul style="list-style-type: none"><li>• 1 to IN_PKT_RDY for last outgoing data packet</li><li>• 1 to IN_PKT_RDY for a zero-length data packet</li><li>• 1 to OUT_PKT_RDY after servicing the last incoming data packet</li></ul>
3	STALL	RW1C	1'b0	Sent STALL. Hardware sets this to 1 when the STALL handshake has been transmitted. Software writes 1 to clear it.
2	SETUP	RW1C	1'b0	SETUP token received. Hardware sets this to 1 and interrupts when the SETUP token has been received. Software writes 1 to clear it.
1	IN_PKT_RDY	RW1S	1'b0	IN packet ready. Software should write 1 to it after loading a data packet into the endpoint 0 IN FIFO. Hardware clears it and generates an interrupt when the data packet has been successfully transmitted.
0	OUT_PKT_RDY	RW1C	1'b0	OUT packet ready. Hardware sets this bit to 1 and generates an interrupt when a data packet has been received. Software writes 1 to clear it after unloading the data packet from the endpoint 0 OUT FIFO.

**Table 9.7 - DC\_EP0\_STATUS – Endpoint 0 Status Register**

### 9.3.3 DC\_EP0\_BUFFER\_LENGTH – Endpoint 0 Buffer Length Register (address offset: 0x24)

This register is used by the hardware to report the length of the packet received in the endpoint 0 OUT buffer.

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	BUF_LEN	RO	7'h00	Indicates the number of data bytes received. Valid only if OUT_PKT_RDY is 1.

**Table 9.8 - DC\_EP0\_BUFFER\_LENGTH – Endpoint 0 Buffer Length Register**

#### 9.3.4 DC\_EP0\_BUFFER – Endpoint 0 Buffer Register (address offset: 0x28)

This register is used to access the endpoint 0 FIFO.

Bit	Name	Type	Default Value	Description
7:0	Data	R/W	8'h00	Endpoint 0 FIFO window register. A read unloads one data byte from the Endpoint 0 OUT FIFO. A write loads one data byte into the Endpoint 0 IN FIFO.

**Table 9.9 - DC\_EP0\_BUFFER – Endpoint 0 Buffer Register**

## 9.4 Other Endpoint Data Flow Registers

This is a set of registers used to access the other endpoints from endpoint 1 to endpoint 7. The register definitions are the same for the registers from endpoint 1 to endpoint 7 but they are located at different offset addresses.

#### 9.4.1 DC\_EP(x)\_CONTROL – Endpoint Control Registers (address offset: 0x2C/0x3C/0x4C/0x5C/0x6C/0x7C/0x8C)

The different endpoints are configured by writing to the corresponding endpoint control register selected based on the corresponding offset address. This register is used to configure the endpoint type, direction, maximum packet size and double buffering. It is also used to stall the corresponding data endpoint.

Bit	Name	Type	Default Value	Description
7	DBL_BUF	RW	1'b0	Endpoint double buffering Enable. 0: double buffering disabled 1: double buffering enabled
6:4	EP_SIZE	RW	3'h0	Endpoint Maximum packet size. This parameter has to be fixed during the Set Configuration request. 0x0: 8 bytes 0x1: 16 bytes 0x2: 32 bytes 0x3: 64 bytes 0x4: 128 bytes 0x5: 256 bytes 0x6: 512 bytes 0x7: 1024 bytes
3	STALL	RW	1'b0	Send STALL. Valid only when the Endpoint is in bulk or interrupt mode. Software should write a 1 to this bit to send a STALL handshake in response to IN token, PING token and data phase of OUT transaction. Software should write a 0 to this bit to terminate the STALL signalling.

2:1	EP_MODE	RW	2'h0	Endpoint Mode. This parameter has to be fixed during the Set Configuration request. 0x0: EP disabled 0x1: EP configured for bulk transfers 0x2: EP configured for interrupt transfers 0x3: EP configured for isochronous transfers
0	EP_DIR	RW	1'b0	Endpoint Direction. This parameter has to be fixed during the Set Configuration request. 0x0: EP direction selected as OUT 0x1: EP direction selected as IN

**Table 9.10 - DC\_EP(x)\_CONTROL – Endpoint Control Registers**

**9.4.2 DC\_EP(x)\_STATUS – Endpoint Status Registers (address offset:  
0x30/0x40/0x50/0x60/0x70/0x80/0x90)**

The different endpoint statuses are read by accessing the corresponding status register. The hardware reports the endpoint status in this register. Write a 1 to the corresponding register bit to clear the bit.

Bit	Name	Type	Default Value	Description
7	CLR_TOGGLE	RW1S	1'b0	Clear data toggle. Software can write a 1 to this bit to reset the Endpoint data toggle to 0. This bit is always read as 0.
6	FIFO_FLUSH	RW1S	1'b0	FIFO Flush. Valid only when the EP direction is IN. Writing 1 to this bit flushes the next packet to be transmitted from the Endpoint IN FIFO. The FIFO pointer is reset and the IN_PKT_RDY bit is cleared. Hardware resets the FLUSH bit to 0 when the FIFO flush is complete.
5	DATA_ERR	RW1C	1'b0	Data error. Valid only when the Endpoint is in isochronous mode and the direction is OUT. This flag is set to 1 by hardware if a received packet has a CRC-16 error. It is automatically cleared when software clears the OUT_PKT_RDY bit.
4	STALL	RW1C	1'b0	Sent STALL. Valid only when the Endpoint is in bulk or interrupt mode. Hardware sets this bit to 1 when the STALL handshake is transmitted. Software can clear this bit by writing a 1 to this bit.
3	UNDER_RUN	RW1C	1'b0	Data underrun. Valid only when the Endpoint direction is IN. Its function is dependent upon the Endpoint mode: Isochronous: Hardware sets this to 1 when a zero-length packet is sent in response to an IN token while IN_PKT_RDY is 0. Bulk/Interrupt: Hardware sets this to 1 when a NAK packet is sent in response to an IN token while IN_PKT_RDY is 0. Software can clear this bit by writing a 1 to this bit.
2	OVER_RUN	RW1C	1'b0	Data overrun. Valid only when the Endpoint is in isochronous mode and the direction is OUT. Hardware sets this bit to 1 if a received packet cannot be loaded into the Endpoint FIFO.

Bit	Name	Type	Default Value	Description
				Software can clear this bit by writing a 1 to this bit.
1	IN_PKT_RDY	RW1S	1'b0	IN packet ready. Valid only when the Endpoint direction is IN. Software should write a 1 to this bit after loading a data packet into the Endpoint IN FIFO. Hardware clears this bit and generates an interrupt when the data packet has been successfully transmitted
0	OUT_PKT_RDY	RW1C	1'b0	OUT packet ready. Valid only when the Endpoint direction is OUT. Hardware sets this bit to 1 and generates an interrupt when a data packet has been received. Software writes a 1 to clear it after unloading the data packet from the Endpoint OUT FIFO.

**Table 9.11 - DC\_EP(x)\_STATUS – Endpoint Status Registers**

**9.4.3 DC\_EP(x)\_BUFFER\_LENGTH\_LSB – Endpoint Buffer Length LSB Registers (address offset: 0x34/0x44/0x54/0x64/0x74/0x84/0x94)**

The different endpoint buffer length is read by accessing the corresponding buffer length register. This register reports the LSB of the OUT-buffer length.

Bit	Name	Type	Default Value	Description
7:0	BUF_LEN_LSB	RO	8'h00	Indicates the low byte of the number of received data bytes in the Endpoint FIFO. Valid only if OUT_PKT_RDY is 1.

**Table 9.12 - DC\_EP(x)\_BUFFER\_LENGTH\_LSB – Endpoint Buffer Length LSB Registers**

**9.4.4 DC\_EP(x)\_BUFFER\_LENGTH\_MSB – Endpoint Buffer Length MSB Registers (address offset: 0x35/0x45/0x55/0x65/0x75/0x85/0x95)**

The different endpoint buffer length is read by accessing the corresponding buffer length register. This register reports the MSB of the OUT-buffer length.

Bit	Name	Type	Default Value	Description
7:3	Reserved	RO	5'h00	-
2:0	BUF_LEN_MSB	RO	3'h0	Indicates the high 3-bit of the number of received data bytes in the Endpoint FIFO. Valid only if OUT_PKT_RDY is 1.

**Table 9.13 - DC\_EP(x)\_BUFFER\_LENGTH\_MSB – Endpoint Buffer Length MSB Registers**

**9.4.5 DC\_EP(x)\_BUFFER – Endpoint Buffer Registers (address offset: 0x38/0x48/0x58/0x68/0x78/0x88/0x98)**

The different endpoint buffer is accessed by accessing the corresponding buffer register.

Bit	Name	Type	Default Value	Description
7:0	buffer	RW	8'h00	Endpoint FIFO window register. A read unloads one data byte from the Endpoint OUT FIFO. A write loads one data byte into the Endpoint IN FIFO.

**Table 9.14 - DC\_EP(x)\_BUFFER – Endpoint Buffer Registers**

## 9.5 General Registers

### 9.5.1 DC\_INT\_STATUS – Interrupt Status Register (address offset: 0x00)

This register indicates that the hardware condition of the corresponding interrupt has occurred. Write a 1 to clear the corresponding bit.

Bit	Name	Type	Default Value	Description
7	PHY	RW1C	1'b0	PHY receive error interrupt status
6	PID	RW1C	1'b0	Package ID error interrupt status
5	CRC16	RW1C	1'b0	CRC16 error interrupt status
4	CRC5	RW1C	1'b0	CRC5 error interrupt status
3	RESM	RW1C	1'b0	Resume interrupt status
2	SUS	RW1C	1'b0	Suspend interrupt status
1	RST	RW1C	1'b0	Reset interrupt status
0	SOF	RW1C	1'b0	Start of Frame interrupt status

**Table 9.15 - DC\_INT\_STATUS – Interrupt Status Register**

### 9.5.2 DC\_EP\_INT\_STATUS – Endpoints Interrupt Status Register (address offset: 0x04)

This register indicates the corresponding endpoint hardware condition has occurred. Write a 1 to clear the corresponding bit.

Bit	Name	Type	Default Value	Description
7	EP7	RW1C	1'b0	Endpoint 7 interrupt status
6	EP6	RW1C	1'b0	Endpoint 6 interrupt status
5	EP5	RW1C	1'b0	Endpoint 5 interrupt status
4	EP4	RW1C	1'b0	Endpoint 4 interrupt status
3	EP3	RW1C	1'b0	Endpoint 3 interrupt status
2	EP2	RW1C	1'b0	Endpoint 2 interrupt status
1	EP1	RW1C	1'b0	Endpoint 1 interrupt status
0	EP0	RW1C	1'b0	Endpoint 0 interrupt status

**Table 9.16 - DC\_EP\_INT\_STATUS – Endpoints Interrupt Status Register**

### 9.5.3 DC\_FRAME\_NUMBER\_LSB – Frame Number LSB Register (address offset: 0x14)

This register has the LSB of the last successfully received SOF.

Bit	Name	Type	Default Value	Description
7:0	FRAME_LSB	RO	8'h00	Frame Number for last received SOF, least significant byte

**Table 9.17 - DC\_FRAME\_NUMBER\_LSB – Frame Number LSB Register**

### 9.5.4 DC\_FRAME\_NUMBER\_MSB – Frame Number MSB Register (address offset: 0x15)

This register has the MSB of the last successfully received SOF.

Bit	Name	Type	Default Value	Description
7:3	Reserved	RO	5'h00	-
2:0	FRAME_MSB	RO	3'h0	Frame Number for last received SOF, Most significant byte

**Table 9.18 - DC\_FRAME\_NUMBER\_MSB – Frame Number MSB Register**

## 10 Ethernet

This is a MAC core that conforms to the IEEE 802.3-2002 specification with the following features:

- Supports 10BASE-T and 100BASE-TX/FX modes
- Supports full and half duplex operation at 10Mbps or 100Mbps
- CRC-32 algorithm calculates the FCS value one nibble at a time, automatic FCS generation and checking, able to capture frames with CRC errors if required
- Programmable MAC address
- Supports promiscuous mode
- Station Management (STA) entity included
- Both TX and RX has a 2kB buffer each (arranged as 512x32)

Listed below is the memory organization of the TX/RX RAM.

Offset	Data Bits	TX RAM Content	RX RAM Content
0x0000	7:0	Data Length LSB	Frame Length LSB
	15:8	Data Length MSB	Frame Length MSB
	23:16	Destination Address Octet 1	Destination Address Octet 1
	31:24	Destination Address Octet 2	Destination Address Octet 2
0x0001	7:0	Destination Address Octet 3	Destination Address Octet 3
	15:8	Destination Address Octet 4	Destination Address Octet 4
	23:16	Destination Address Octet 5	Destination Address Octet 5
	31:24	Destination Address Octet 6	Destination Address Octet 6
0x0002	7:0	Source Address Octet 1	Source Address Octet 1
	15:8	Source Address Octet 2	Source Address Octet 2
	23:16	Source Address Octet 3	Source Address Octet 3
	31:24	Source Address Octet 4	Source Address Octet 4
0x0003	7:0	Source Address Octet 5	Source Address Octet 5
	15:8	Source Address Octet 6	Source Address Octet 6
	23:16	Type/Len MSB	Type/Len MSB
	31:24	Type/Len LSB	Type/Len LSB
0x0004 - 0x01FF	7:0	Data octet n	Data octet n
	15:8	Data octet n+1	Data octet n+1
	23:16	Data octet n+2	Data octet n+2
	31:24	Data octet n+3	Data octet n+3

**Table 10.1 - Memory Organization of TX/RX RAM**

The memory is accessed indirectly using the data register. Data bits from the table above directly correspond to data bits of the Data Register. The TX RAM offset in the table above corresponds directly to the RAM address. The RX RAM offset in the table above defines the distance from the beginning of the frame in the FIFO. Z

### 10.1 Register Summary

Listed below are the registers with their offset from the base address (0x10220). All registers and buffer locations can only be accessed via Byte (8-bit), Word (16-bit) or Double-Word (32-bit). However, the FIFO must be accessed in Double-Word mode only.

Table 10.2 - Overview of Ethernet Registers

## 10.2 Register Details

### 10.2.1 ETH\_INT\_STATUS – Interrupt Status Register (address offset: 0x0)

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	-
5	MD_INT	RW1C	1'b0	Set when a transaction on the MII management interface has completed successfully (either read or write).

Bit	Name	Type	Default Value	Description
				Write a 1 to clear the status flag.
4	RX_ERR	RW1C	1'b0	Set when an error on RX has been encountered. This occurs when the RXER input pin is sampled high during frame reception (100 Mbps only), or the frame is not an integer number of octets and the FCS check failed (dribble bits in frame) – alignment error, or the frame has a wrong CRC, or the length/type field is inconsistent with the client data size. Write a 1 to clear the status flag.
3	FIFO_OV	RW1C	1'b0	Set when RX FIFO overrun is encountered. Write a 1 to clear the status flag.
2	TX_EMPTY	RW1C	1'b0	Set when a packet has been sent. Write a 1 to clear the status flag.
1	TX_ERR	RW1C	1'b0	Set when an error on TX has been encountered. This occurs when the Data Length field value stored in the TX RAM exceeds 2032 in which case the frame will not be sent when this condition is encountered, or the retransmission attempt limit (16) has failed during a truncated binary exponential back off process. Write a 1 to clear the status flag. The write data pointer is also reset in this case.
0	RX_INT	RAC	1'b0	Set when at least one packet is in the receiver's FIFO. This status flag will be cleared by hardware when there is no packet in the receiver FIFO

**Table 10.3 - ETH\_INT\_STATUS - Interrupt Status Register**

**Note:** The individual status will still be reflected even if the individual interrupt has been disabled. This allows polling by software.

#### 10.2.2 ETH\_INT\_ENABLE - Interrupt Enable Register (address offset: 0x1)

Setting a bit in this register enables the interrupt. Clearing a bit in this register disables the interrupt.

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	-
5	MD_INT_MASK	RW	1'b1	Mask for MD_INT interrupt
4	RX_ERR_MASK	RW	1'b1	Mask for RX_ERR interrupt
3	FIFO_OV_MASK	RW	1'b1	Mask for FIFO_OV interrupt
2	TX_EMPTY_MASK	RW	1'b1	Mask for TX_EMPTY interrupt
1	TX_ERR_MASK	RW	1'b1	Mask for TX_ERR interrupt
0	RX_MASK	RW	1'b1	Mask for RX_INT interrupt

**Table 10.4 - ETH\_INT\_ENABLE - Interrupt Enable Register**

### 10.2.3 ETH\_RX\_CNTL – Receive Control Register (address offset: 0x02)

This register configures the receiver.

Bit	Name	Type	Default Value	Description
7:6	RX_MEM_SIZE	RO	2'h0	Memory size – 2048 Bytes
5	Reserved	-	-	-
4	RESET_FIFO	RW	1'b0	1: clears the receiver FIFO; should be done when software initialisation of MAC is needed. It is recommended to set RX_ENABLE 0 first.
3	BAD_CRC	RW	1'b1	1: all frames with wrong CRC will be discarded; all valid frames with broadcast address FF-FF-FF-FF-FF-FF in the Destination Address field are captured 0: do not drop frames with the wrong CRC. RX_ERR will still be flagged to indicate an erroneous packet has been received. The erroneous packet should be read out to make place for subsequent packets.
2	PRMS_MODE	RW	1'b0	1: Promiscuous mode enabled; all valid frames regardless of destination address will be captured, including multicast and broadcast frames. 0: Promiscuous mode disabled
1	ACC_MULTI	RW	1'b0	1: Accept multicast; accepts all frames which have first bit of Destination Address set.
0	RX_ENABLE	RW	1'b0	1: enable frame receiver 0: disable frame receiver

**Table 10.5 - ETH\_RX\_CNTL – Receive Control Register**

### 10.2.4 ETH\_TX\_CNTL – Transmit Control Register (address offset: 0x03)

This register configures the transmitter.

Bit	Name	Type	Default Value	Description
7:6	TX_MEM_SIZE	RO	2'h0	Memory size – 2048 Bytes
5	Reserved	-	-	-
4	DUPLEX_MODE	RW	1'b0	1: enable duplex mode for Ethernet transmitter 0: disable duplex mode for Ethernet transmitter
3	Reserved	-	-	-
2	CRC_ENABLE	RW	1'b0	1: frames will be sent with CRC appended 0: frames will be sent without CRC appended
1	PAD_ENABLE	RW	1'b0	1: padding will be appended to frames

				shorter than the minimum frame size 0: padding will not be appended to frames shorter than the minimum frame size
0	TX_ENABLE	RW	1'b0	1: enable transmitter 0: disable transmitter

**Table 10.6 - ETH\_TX\_CNTL – Transmit Control Register**

**10.2.5 ETH\_DATA\_N0 – Data Register (octet n) (address offset: 0x04)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	For read/write from/to data buffer (RX/TX RAM)

**Table 10.7 - ETH\_DATA\_N0 – Data Register (octet n)**

**10.2.6 ETH\_DATA\_N1 – Data Register (octet n+1) (address offset: 0x05)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	For read/write from/to data buffer (RX/TX RAM)

**Table 10.8 - ETH\_DATA\_N1 – Data Register (octet n+1)**

**10.2.7 ETH\_DATA\_N2 – Data Register (octet n+2) (address offset: 0x06)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	For read/write from/to data buffer (RX/TX RAM)

**Table 10.9 - ETH\_DATA\_N2 – Data Register (octet n+2)**

**10.2.8 ETH\_DATA\_N3 – Data Register (octet n+3) (address offset: 0x07)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	For read/write from/to data buffer (RX/TX RAM)

**Table 10.10 - ETH\_DATA\_N3 – Data Register (octet n+3)**

**10.2.9 ETH\_ADDR\_1 – Address Register (octet 1) (address offset: 0x08)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.11 - ETH\_ADDR\_1 – Address Register (octet 1)**

**10.2.10 ETH\_ADDR\_2 – Address Register (octet 2) (address offset: 0x09)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.12 - ETH\_ADDR\_2 – Address Register (octet 2)**

**10.2.11 ETH\_ADDR\_3 – Address Register (octet 3) (address offset: 0x0A)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.13 - ETH\_ADDR\_3 – Address Register (octet 3)**
**10.2.12 ETH\_ADDR\_4 – Address Register (octet 4) (address offset: 0x0B)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.14 - ETH\_ADDR\_4 – Address Register (octet 4)**
**10.2.13 ETH\_ADDR\_5 – Address Register (octet 5) (address offset: 0x0C)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.15 - ETH\_ADDR\_5 – Address Register (octet 5)**
**10.2.14 ETH\_ADDR\_6 – Address Register (octet 6) (address offset: 0x0D)**

Bit	Name	Type	Default Value	Description
7:0	ADDRESS	RW	8'h00	MAC hardware address octet

**Table 10.16 - ETH\_ADDR\_6 – Address Register (octet 6)**
**10.2.15 ETH\_THRESHOLD – Threshold Register (address offset: 0x0E)**

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	-
5:0	THRESHOLD	RW	6'h00	This threshold specifies the threshold level for the TX RAM to begin transmission. When the byte count of the data in the TX RAM reaches this level, the transmission will start. Transmission starts when: Number of bytes written >= 4 * (THRESHOLD * 8 + 1)

**Table 10.17 - ETH\_THRESHOLD – Threshold Register**
**10.2.16 ETH\_MNG\_CNTL – Management Control Register (address offset: 0x0F)**

This register is used to send management frames from the STA entity across the MII management interface

Bit	Name	Type	Default Value	Description
7:3	REG_ADDRESS	RW	5'h00	These set the MII register address for the next transaction.

2	Reserved	-	-	-
1	WRITE	RW	1'b0	This bit should be updated together with the START bit. 1: perform write transaction 0: perform read transaction
0	START	RW	1'b0	Setting this bit to 1 will initiate the transaction. Hardware clears this bit after the transaction is complete.

**Table 10.18 - ETH\_MNG\_CNTL – Management Control Register**

#### 10.2.17 ETH\_MNG\_DIV – Management Divider Register (address offset: 0x10)

Bit	Name	Type	Default Value	Description
7:0	DIV	RW	8'h80	This is used to set the clock divider for the MDC clock used by the STA to clock transactions between PHY and MAC across the serial MII interface.  The MDC clock is derived as follows: $F_{mdc} = \frac{F_{clk}}{2 * (MDVR + 1)}$

**Table 10.19 - ETH\_MNG\_DIV – Management Divider Register**

#### 10.2.18 ETH\_MNG\_ADDR – Management Address Register (address offset: 0x11)

Bit	Name	Type	Default Value	Description
7:5	Reserved	-	-	-
4:0	PHY_ADDRESS	RW	5'h00	This register should be updated with the PHY address

**Table 10.20 - ETH\_MNG\_ADDR – Management Address Register**

#### 10.2.19 ETH\_MNG\_TX0 – Management Transmit Data 0 Register (address offset: 0x12)

Bit	Name	Type	Default Value	Description
7:0	TX_LSB	RW	8'h00	This is the lower byte of a word of data to be sent across the MII management interface to the PHY during the next data transmission

**Table 10.21 - ETH\_MNG\_TX0 – Management Transmit Data 0 Register**

#### 10.2.20 ETH\_MNG\_TX1 – Management Transmit Data 1 Register (address offset: 0x13)

Bit	Name	Type	Default Value	Description
7:0	TX_MSB	RW	8'h00	This is the upper byte of a word of data to be sent across the MII management interface to the PHY during the next data transmission

**Table 10.22 - ETH\_MNG\_TX1 – Management Transmit Data 1 Register**

**10.2.21 ETH\_MNG\_RX0 – Management Receive Data 0 Register (address offset: 0x14)**

Bit	Name	Type	Default Value	Description
7:0	RX_LSB	RW	8'h00	This is the lower byte of a word of data read by the STA management entity from the PHY during the last transaction

**Table 10.23 - ETH\_MNG\_RX0 – Management Receive Data 0 Register**
**10.2.22 ETH\_MNG\_RX1 – Management Receive Data 1 Register (address offset: 0x15)**

Bit	Name	Type	Default Value	Description
7:0	RX_MSB	RW	8'h00	This is the upper byte of a word of data read by the STA management entity from the PHY during the last transaction

**Table 10.24 - ETH\_MNG\_RX1 – Management Receive Data 1 Register**
**10.2.23 ETH\_NUM\_PKT – Number of Packets Register (address offset: 0x16)**

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	-
5:0	NUM_PKT	RO	6'h00	This is the number of packets in the receive FIFO. When NPR is greater than 0, RXINT interrupt will be active

**Table 10.25 - ETH\_NUM\_PKT – Number of Packets Register**
**10.2.24 ETH\_TR\_REQ – Transmission Request Register (address offset: 0x17)**

Bit	Name	Type	Default Value	Description
7:1	Reserved	-	-	-
0	NEW_TX	RW1S	1'b0	1: Send the new frame in transmit memory. Hardware clears this bit when the transmission is complete or an error on TX is encountered.

**Table 10.26 - ETH\_TR\_REQ – Transmission Request Register**

## 11 CAN Bus Controller

Two CAN bus controllers are supported by this device. The controllers have the following features.

- Conforms to Bosch CAN 2.0B specification
- Data rate up to 1Mbps
- Hardware message filtering (dual/single filters)
- 64-byte receive FIFO
- 16-byte transmit buffer
- No overload frames are generated
- Normal & Listen Only modes supported
- Single Shot transmission
- Ability to abort transmission
- Readable error counters
- Last Error Code

Listed below are the symbols used in the CAN Frame buffer.

Symbol	Description
FF	Frame Format
RTR	Remote Request bit 1: Remote Frames 0: Data Frames
X	Don't care
DLC	Data Length Code
ID	CAN Message identifier
DATA1 – DATA8	Data bytes

**Table 11.1 - Symbols used in the CAN Frame buffer**

The memory buffer layout for standard frames is:

Offset	Data Bits	Standard Frame buffer content for TX/RX RAM								
0x00	7:0	FF	RTR	X/0	X/0	DLC3	DLC2	DLC1	DLC0	
	15:8	ID10	ID9	ID8	ID7	ID6	ID5	ID4	ID3	
	23:16	ID2	ID1	ID0	X/RTR	X/0	X/0	X/0	X/0	
	31:24									DATA1
0x01	7:0									DATA2
	15:8									DATA3
	23:16									DATA4
	31:24									DATA5
0x02	7:0									DATA6
	15:8									DATA7
	23:16									DATA8
	31:24									UNUSED
0x03	7:0									UNUSED
	15:8									UNUSED

	23:16	UNUSED						
	31:24	UNUSED						

**Table 11.2 - Standard Frames Memory Buffer Layout**

The memory buffer layout for extended frames is:

Offset	Data Bits	Extended Frame buffer content for TX/RX RAM							
0x00	7:0	FF	RTR	X/0	X/0	DLC3	DLC2	DLC1	DLC0
	15:8	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21
	23:16	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13
	31:24	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5
0x01	7:0	ID4	ID3	ID2	ID1	ID0	X/RTR	X/0	X/0
	15:8	DATA1

**Table 11.4 - Overview of CAN Registers**

## 11.2 Register Details

### 11.2.1 CAN\_MODE – Mode Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7:3	Reserved	-	-	-
2	RST	RW	1'b1	Reset Mode 1: Controller in reset mode; no frame reception and transmission are possible. This mode is used to configure the controller hardware
1	LSTN_ONLY	RW	1'b0	Listen Only Mode Updatable only when RST is 1 0: Normal Mode 1: Listen only mode
0	ACC_FLTR	RW	1'b0	Hardware Acceptance Filter Scheme Updatable only when RST is 1 0: dual filter is used for hardware acceptance filter scheme 1: single filter is used for hardware acceptance filter scheme

**Table 11.5 - CAN\_MODE – Mode Register**

### 11.2.2 CAN\_CMD – Command Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7:3	Reserved	-	-	-
2	TX_REQ	W1S	1'b0	Transmit Request 1: Initiates frames transmission by Bit Stream Processor 0: No effect
1	ABORT_TX	WO	1'b0	Abort Transmission When writing 1 to this bit simultaneously with TX_REQ bit, 1-shot transmission is performed. If TX_REQ has been set to 1, and the transmission has not started, writing a 1 to ABORT_TX will abort the request.

0	Reserved	-	-	-
---	----------	---	---	---

**Table 11.6 - CAN\_CMD – Command Register**
**11.2.3 CAN\_STATUS – Status Register (address offset: 0x02)**

Bit	Name	Type	Default Value	Description
7	RX_BUF_STS	RO	1'b0	Receive Buffer Status: 1: at least one message is in RX FIFO. 0: no message is in RX FIFO
6	OVRN_STS	RO	1'b0	Data Overrun Status 1: when RX FIFO encounters overrun. 0: no overrun occurred since the last clear data overrun command  This bit is cleared when a 1 is written to DATA_OVRN bit.
5	TX_BUF_STS	RO	1'b1	Transmit Buffer Status 1: transmit buffer can be written. 0: transmission in progress and transmit buffer is locked such that no data write can be accepted.
4	Reserved	-	-	-
3	RX_STS	RO	1'b0	Receive Status 1: when the CAN core is receiving a message.
2	TX_STS	RO	1'b0	Transmit Status 1: when the CAN core is transmitting a message.
1	ERR_STS	RO	1'b0	Error Status 1: when at least one of CAN error counters has reached error warning limit (96). This bit is automatically cleared when the error counter is below the limit.
0	BUS_OFF_STS	RO	1'b0	Bus Off Status 1: Node is in bus off state and cannot transmit and receive frames. When the transmit error counter exceeds the limit of 255, this bit will be set to 1, the CAN controller sets reset mode, and if enabled an error warning interrupt is generated. The transmit error counter is then set to 127 and receive error counter is cleared. The CAN controller stays in reset mode until the CPU clears the reset mode bit. Once this is completed the CAN controller waits for 128 occurrences of the bus free signal (11 consecutive recessive bits) counting down the transmit error counter. After that this bit is cleared (bus on), the error counters are reset and the error warning interrupt is generated if enabled.

**Table 11.7 - CAN\_STATUS – Status Register**

**11.2.4 CAN\_INT\_STATUS – Interrupt Status Register (address offset: 0x03)**

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	ARB_LOST	RW1C	1'b0	Arbitration Lost Interrupt Set when the CAN core has lost arbitration during transmission of its own message and become a receiver Write a 1 to clear this interrupt.
5	ERR_WRNG	RW1C	1'b0	Error Warning Interrupt Set when there is a change in ERR_STS or BUS_OFF_STS bits of Status register. Write a 1 to clear this interrupt.
4	ERR_PSV	RW1C	1'b0	Error Passive Interrupt Set when CAN core has reached or exceeded error passive level. Write a 1 to clear this interrupt.
3	RX	RW1C	1'b0	Receive Interrupt Set when there is at least one message in the RX FIFO. Write a 1 to decrement the RX message counter (NUM_FRM). NUM_FRM is not decremented automatically. Note that this flag is cleared after the first message is read. The interrupt handler should check how many messages there are (NUM_FRM) and read all of them out.
2	TX	RW1C	1'b0	Transmission Interrupt Set after a successful transmission. Write a 1 to reset the write pointer to TX RAM before writing the next frame of data.
1	BUS_ERR	RW1C	1'b0	Bus Error Interrupt Set when the CAN core encounters a bus error while transmitting or receiving a message. Write a 1 to clear this interrupt.
0	DATA_OVRN	RW1C	1'b0	Data Overrun Interrupt Set when the RX FIFO overrun has occurred. Write a 1 to clear this interrupt.

**Table 11.8 - CAN\_INT\_STATUS – Interrupt Status Register**
**11.2.5 CAN\_INT\_ENABLE – Interrupt Enable Register (address offset: 0x04)**

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	ARB_LOST_EN	RW	1'b0	Mask for ARB_LOST interrupt.
5	ERR_WRNG_EN	RW	1'b0	Mask for ERR_WRNG interrupt.
4	ERR_PSV_EN	RW	1'b0	Mask for ERR_PSV interrupt.

3	RX_EN	RW	1'b0	Mask for RX interrupt.
2	TX_EN	RW	1'b0	Mask for TX interrupt.
1	BUS_ERR_EN	RW	1'b0	Mask for BUS_ERR interrupt.
0	DATA_OVRN_EN	RW	1'b0	Mask for DATA_OVRN interrupt.

**Table 11.9 - CAN\_INT\_ENABLE – Interrupt Enable Register**

#### 11.2.6 CAN\_RX\_MSG – Receive Message Register (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7:5	Reserved	-	-	-
4:0	NUM_FRM	RO	5'h00	Number of stored message frames This shows the number of frames stored in the RX FIFO. The value is incremented on each successful frame reception and decremented by clearing the RX interrupt. Up to 21 messages can be stored. This equation shows the calculation: $n = \frac{64}{3 + \text{data\_length\_code}}$

**Table 11.10 - CAN\_RX\_MSG – Receive Message Register**

#### 11.2.7 CAN\_BUS\_TIM\_0 – Bus Timing 0 Register (address offset: 0x06)

Bit	Name	Type	Default Value	Description
7:6	SYNC_JMP_WDT	RW	2'h0	Synchronisation Jump Width This allows compensation for phase shifts between clocks of different bus controllers. The maximum number of clock cycles a bit period may be changed by one resynchronisation is defined by SYNC_JMP_WDT as: $T_{\text{SYNC\_JMP\_WDT}}: t_{\text{sclk}} \times (2 \times \text{SYNC\_JMP\_WDT}[1] + \text{SYNC\_JMP\_WDT}[0] + 1)$
5:0	BAUD_PSCL	RW	6'h00	Baud Rate Prescaler Baud rate can be set using this equation: $\text{BAUD\_PSCL}: (32 \times \text{BAUL\_PSCL}[5] + 16 \times \text{BAUD\_PSCL}[4] + 8 \times \text{BAUD\_PSCL}[3] + 4 \times \text{BAUD\_PSCL}[2] + 2 \times \text{BAUD\_PSCL}[1] + \text{BAUD\_PSCL}[0])$ The period of CAN system clock tsclk is thus: $t_{\text{sclk}}: 2 \times t_{\text{clk}} \times \text{BAUD\_PSCL}$

**Table 11.11 - CAN\_BUS\_TIM\_0 – Bus Timing 0 Register**

#### 11.2.8 CAN\_BUS\_TIM\_1 – Bus Timing 1 Register (address offset: 0x07)

Bit	Name	Type	Default Value	Description
7	NUM_SAM	RW	1'b0	Number of bus level samples 0: bus level is sampled once (recommended for high-speed buses)

				1: bus level is sampled three times (recommended for low/medium speed buses where there is a benefit from filtering spikes)
6:4	TIM_SEG2	RW	3'h0	Number of clock cycles per Time Segment 2 $t_{TIM\_SEG2} = t_{sclk} \times (4 \times TIM\_SEG1[2] + 2 \times TIM\_SEG1[1] + TIM\_SEG1[0] + 1)$
3:0	TIM_SEG1	RW	4'h0	Number of clock cycles per Time Segment 1 $t_{TIM\_SEG1} = t_{sclk} \times (8 \times TIM\_SEG1[3] + 4 \times TIM\_SEG1[2] + 2 \times TIM\_SEG1[1] + TIM\_SEG1[0] + 1)$

**Table 11.12 - CAN\_BUS\_TIM\_1 – Bus Timing 1 Register**

### 11.2.9 CAN\_TX\_BUF - Transmit Buffer Register

The Transmit Buffer Register (CAN\_TX\_BUF) is used to write a CAN frame which will be sent over the CAN network. It is a write-only register. This register is mapped into four consecutive byte locations starting at offset 0x08. Users can access these locations through registers CAN\_TX\_BUF\_0 to CAN\_TX\_BUF\_3. The byte at location CAN\_TX\_BUF\_0 is least significant, while the byte at location CAN\_TX\_BUF\_3 is most significant.

Writing to the Transmit Buffer Register performs auto increment of the internal write pointer. This pointer is the actual address to the CAN TX RAM. Auto increment is executed only when location CAN\_TX\_BUF\_3 is accessed.

The write pointer can be reset by writing a 1 to bit TX of the Interrupt Status Register. Refer to [section 11.2.4](#) for further information.

#### 11.2.9.1 CAN\_TX\_BUF\_0 – Transmit Buffer 0 Register (address offset: 0x08)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	This is used to write a CAN frame for transmission. When write is performed on CAN_TX_BUF_0 the internal write pointer will be automatically incremented. This pointer can be reset by writing a 1 to TX of the Interrupt Status register.

**Table 11.13 - CAN\_TX\_BUF\_0 – Transmit Buffer 0 Register**

#### 11.2.9.2 CAN\_TX\_BUF\_1 – Transmit Buffer 1 Register (address offset: 0x09)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	This is used to write a CAN frame for transmission. When write is performed on CAN_TX_BUF_1 the internal write pointer will be automatically incremented. This pointer can be reset by writing a 1 to TX of the Interrupt Status register.

**Table 11.14 - CAN\_TX\_BUF\_1 – Transmit Buffer 1 Register**

### 11.2.9.3 CAN\_TX\_BUF\_2 – Transmit Buffer 2 Register (address offset: 0x0A)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	This is used to write a CAN frame for transmission. When write is performed on CAN_TX_BUF_2 the internal write pointer will be automatically incremented. This pointer can be reset by writing a 1 to TX of the Interrupt Status register.

**Table 11.15 - CAN\_TX\_BUF\_2 – Transmit Buffer 2 Register**

### 11.2.9.4 CAN\_TX\_BUF\_3 – Transmit Buffer 3 Register (address offset: 0x0B)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	This is used to write a CAN frame for transmission. When write is performed on CAN_TX_BUF_3, the internal write pointer will be automatically incremented. This pointer can be reset by writing a 1 to TX of the Interrupt Status register.

**Table 11.16 - CAN\_TX\_BUF\_3 – Transmit Buffer 3 Register**

### 11.2.10 CAN\_RX\_BUF – Receive Buffer Register

The Receive Buffer Register (CAN\_RX\_BUF) is used to read CAN frames received from the CAN network. It is a read-only register. This register is mapped into four consecutive byte locations starting at offset 0x0C. The users can access these locations through registers CAN\_RX\_BUF\_0 to CAN\_RX\_BUF\_3. The byte at location CAN\_RX\_BUF\_0 is least significant, while the byte at location CAN\_RX\_BUF\_3 is most significant.

Reading the Receive Buffer Register performs auto increment of the internal read pointer. This pointer is the actual address to the CAN RX FIFO. Auto increment is executed only when location CAN\_RX\_BUF\_3 is accessed.

#### 11.2.10.1 CAN\_RX\_BUF\_0 – Receive Buffer 0 Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	This is used to read a received CAN frame. When read is performed on CAN_RX_BUF_3, the internal read pointer will be automatically incremented.

**Table 11.17 - CAN\_RX\_BUF\_0 – Receive Buffer 0 Register**

#### 11.2.10.2 CAN\_RX\_BUF\_1 – Receive Buffer 1 Register (address offset: 0x0D)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	This is used to read a received CAN frame. When read is performed on CAN_RX_BUF_3, the internal read pointer will be automatically incremented.

**Table 11.18 - CAN\_RX\_BUF\_1 – Receive Buffer 1 Register**

### 11.2.10.3 CAN\_RX\_BUF\_2 – Receive Buffer 2 Register (address offset: 0x0E)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	This is used to read a received CAN frame. When read is performed on CAN_RX_BUF_3, the internal read pointer will be automatically incremented.

**Table 11.19 - CAN\_RX\_BUF\_2 – Receive Buffer 2 Register**

### 11.2.10.4 CAN\_RX\_BUF\_3 – Receive Buffer 3 Register (address offset: 0x0F)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	This is used to read a received CAN frame. When read is performed on CAN_RX_BUF_3, the internal read pointer will be automatically incremented.

**Table 11.20 - CAN\_RX\_BUF\_3 – Receive Buffer 3 Register**

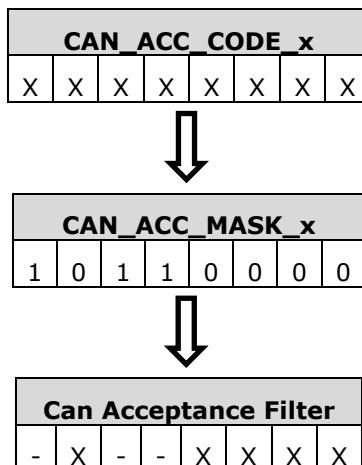

### 11.2.11 CAN Acceptance Filter

The acceptance filter makes it possible to pass received messages to the RX FIFO only when the identifier bits of the received message are equal to the predefined ones within the acceptance filter registers.

The acceptance filter is defined by the acceptance code registers (CAN\_ACC\_CODE\_3:CAN\_ACC\_CODE\_0) and acceptance mask registers (CAN\_ACC\_MASK\_3:CAN\_ACC\_MASK\_0).

The acceptance code registers contain bit patterns of messages to be received while the corresponding acceptance mask registers define which bit positions will be compared and which ones are “don’t care”. Writing a 1 to a certain bit in CAN\_ACC\_MASK\_x defines the corresponding bit in CAN\_ACC\_CODE\_x as “don’t care”.

The figure below demonstrates the process. An ‘X’ shows that the corresponding bit in CAN\_ACC\_CODE\_x is used in the filter and a minus ‘-’ shows that the bit is ignored:

**Figure 11.1 - CAN Acceptance Filter**

The ACC\_FLTR bit of the [Mode Register \(CAN\\_MODE\)](#) sets one of the two available filter configurations: single or dual filter.

### **Single Filter Configuration:**

In single filter configuration, one long filter can be defined (four bytes). If a standard frame message is received, the complete identifier including RTR bit and the first two data bytes (if received) are used for acceptance filtering. Messages may also be accepted if there is no data byte. If only one data byte is received, then only bits up to this data byte are compared with the filter. All single bit comparisons have to signal acceptance for successful reception of message.

If an extended frame message is received while in single filter configuration, the complete identifier including the RTR bit is used for acceptance filtering. Again, for successful reception, all single bit comparisons have to signal acceptance.

### **Dual Filter Configuration:**

In dual filter configuration, two short filters can be defined. The received message is compared to both filters to decide whether this message should be stored in the RX FIFO. If at least one of the messages filters signals acceptances, the message is accepted.

If a standard frame message is received, the first filter compares the complete standard identifier including RTR bit and the first data byte of the message. The second filter only compares the complete standard identifier including RTR bit. For successful reception of a message, all single bit comparisons of at least one filter must signal acceptance. If no data byte is required for filter 1, the four least significant bits of AMR1 and AMR3 have to be set to 1 (don't care).

If an extended frame message is received while in dual filter mode, both filters are comparing the first two bytes of the extended identifier range only. For a successful reception, all single bit comparisons of at least one filter have to signal acceptance.

The content of the acceptance code registers (CAN\_ACC\_CODE\_3: CAN\_ACC\_CODE\_0), depending on the filter configuration and the frame type, is presented below. Please refer to table 11.2 and 11.3 for the bits in a CAN message. For simplicity, the tables refer to the different settings as:

- Setting 1: Single filter configuration, standard frame message
- Setting 2: Single filter configuration, extended frame message
- Setting 3: Dual filter configuration, standard frame message
- Setting 4: Dual filter configuration, extended frame message

A particular bit in CAN\_ACC\_CODE\_x can always be ignored by setting the corresponding bit in CAN\_ACC\_MASK\_x to 1. It is recommended to set the mask to 1 for the unused bits in CAN\_ACC\_CODE\_x.

#### ***11.2.11.1 CAN\_ACC\_CODE\_0 – Acceptance Code 0 Register (address offset: 0x10)***

Bit	Name	Type	Default Value	Description			
				Setting 1	Setting 2	Setting 3	Setting 4

**11.2.11.7 CAN\_ACC\_MASK\_2 – Acceptance Mask 2 Register (address offset: 0x16)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	This register determines which bits in CAN_ACC_CODE_2 is used for the acceptance filter. A 1 in a particular bit means that the corresponding bit in CAN_ACC_CODE_2 will not be compared.

**Table 11.27 - CAN\_ACC\_MASK\_2 – Acceptance Mask 2 Register**
**11.2.11.8 CAN\_ACC\_MASK\_3 – Acceptance Mask 3 Register (address offset: 0x17)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	This register determines which bits in CAN_ACC_CODE_3 is used for the acceptance filter. A 1 in a particular bit means that the corresponding bit in CAN_ACC_CODE_3 will not be compared.

**Table 11.28 - CAN\_ACC\_MASK\_3 – Acceptance Mask 3 Register**
**11.2.12 CAN\_ERR\_CODE – Error Code Capture Register (address offset: 0x18)**

Bit	Name	Type	Default Value	Description
7	RX_WRN	RO	1'b0	Set when RX_ERR counter is greater than or equal to 96.
6	TX_WRN	RO	1'b0	Set when TX_ERR counter is greater than or equal to 96.
5	ERR_DIR	RO	1'b0	Direction of transfer when error occurred. 0: transmission 1: reception
4	ACK_ERR	RO	1'b0	ACK error occurred.
3	FRM_ERR	RO	1'b0	Form error occurred.
2	CRC_ERR	RO	1'b0	CRC error occurred.
1	STF_ERR	RO	1'b0	Stuff error occurred.
0	BIT_ERR	RO	1'b0	Bit error occurred.

**Table 11.29 - CAN\_ERR\_CODE – Error Code Capture Register**
**11.2.13 CAN\_RX\_ERR\_CNTR – Receive Error Counter Register (address offset: 0x19)**

Bit	Name	Type	Default Value	Description
7:0	RX_ERR	RO	8'h00	This is the current receive error counter. If a bus off event occurs, it is initialized to 0.

**Table 11.30 - CAN\_RX\_ERR\_CNTR – Receive Error Counter Register**

**11.2.14 CAN\_TX\_ERR\_CNTR – Transmit Error Counter Register (address offset: 0x1A)**

Bit	Name	Type	Default Value	Description
7:0	TX_ERR	RO	8'h00	This is the low-byte of the current transmit error counter as the width of the transmit error counter is 9-bit. If a bus off event occurs, it is initialized to 127 to count the minimum protocol defined time (128 occurrences of bus free signal). Reading TX_ERR during this time gives information about the status of the bus off recovery.

**Table 11.31 - CAN\_TX\_ERR\_CNTR – Transmit Error Counter Register**
**11.2.15 CAN\_ARB\_LOST\_CODE – Arbitration Lost Code Capture Register (address offset: 0x1B)**

Bit	Name	Type	Default Value	Description
7:5	Reserved	-	-	-
4:0	ARB_CODE	RO	5'h00	This contains the bit position at which arbitration was lost during transmission of a message. This register is not updated until the previous arbitration lost interrupt has been acknowledged.

**Table 11.32 - CAN\_ARB\_LOST\_CODE – Arbitration Lost Code Capture Register**

## 12 SD Host

The device supports a SD Host with the following features.

- Supports PIO data transfers
- Supports configurable SD bus modes: 4-bit mode and 8-bit mode
- Supports configurable 8-word/16-word register for data FIFO
- Supports configurable 1K/2K/4K SRAM for data FIFO
- Supports configurable 1-bit/4-bit SD card bus and 1-bit/4-bit/8-bit MMC card bus
- Configurable CPRM function for security
- Built-in generation and check for 7-bit and 16-bit CRC data
- Card detection (Insertion/Removal)
- Supports Read Wait mechanism for SDIO function
- Supports Suspend/Resume mechanism for SDIO function

### 12.1 Register Summary

Listed below are the registers with their offset from the base address (0x10400). All registers can only be accessed via Double-Word (32-bit) mode. Note that some registers are not 32-bit long. In that case, several registers are combined into one 32-bit location. If one such register is accessed, all other registers in the same 32-bit location will also be affected. The users need to take care not to modify the content of the other registers.

Address Offset	Register	Default Value	References
<b>0x00</b>	SDH_AUTO_CMD23_ARG2 – Auto CMD23 Argument 2 Register	0x00000000	<a href="#">Section 12.2.1</a>

<b>0x114</b>	SDH_VNDR_5 – Vendor defined 5 Register	0x00000000	<a href="#">Section 12.2.47</a>
<b>0x118</b>	SDH_VNDR_6 – Vendor defined 6 Register	0x00000000	<a href="#">Section 12.2.48</a>
<b>0x11C</b>	SDH_VNDR_7 – Vendor defined 7 Register	0x00000000	<a href="#">Section 12.2.49</a>
<b>0x120</b>	SDH_VNDR_8 – Vendor defined 8 Register	0x00000000	<a href="#">Section 12.2.50</a>
<b>0x124</b>	SDH_VNDR_9 – Vendor defined 9 Register	0x00000000	<a href="#">Section 12.2.51</a>
<b>0x128</b>	SDH_RSRV_6 – Reserved 6 Register	0x00000000	<a href="#">Section 12.2.52</a>
<b>0x178</b>	SDH_HW_ATTR – Hardware Attributes Register	0x00000150	<a href="#">Section 12.2.53</a>
<b>0x180</b>	SDH_CPR_MOD_CNTL – Cipher Mode Control Register	0x00000000	<a href="#">Section 12.2.54</a>
<b>0x184</b>	SDH_CPR_MOD_STATUS – Cipher Mode Status Register	0x00000000	<a href="#">Section 12.2.55</a>
<b>0x188z</b>	SDH_CPR_MOD_STATUS_EN – Cipher Mode Status Enable Register	0x0000	<a href="#">Section 12.2.56</a>
<b>0x18A</b>	SDH_CPR_MOD_SIG_EN – Cipher Mode Signal Enable Register	0x0000	<a href="#">Section 12.2.57</a>
<b>0x18C</b>	SDH_IN_DATA_LSB – Input Data LSB Register	0x00000000	<a href="#">Section 12.2.58</a>
<b>0x190</b>	SDH_IN_DATA_MSB – Input Data MSB Register	0x00000000	<a href="#">Section 12.2.59</a>
<b>0x194</b>	SDH_IN_KEY_LSB – Input Key LSB Register	0x00000000	<a href="#">Section 12.2.60</a>
<b>0x198</b>	SDH_IN_KEY_MSB – Input Key MSB Register	0x00000000	<a href="#">Section 12.2.61</a>
<b>0x19C</b>	SDH_OUT_DATA_LSB – Output Data LSB Register	0x00000000	<a href="#">Section 12.2.62</a>

<b>0x1A0</b>	SDH_OUT_DATA_MSB – Output Data MSB Register	0x00000000	<a href="#">Section 12.2.63</a>
<b>0x1A4</b>	SDH_SCRT_CONS_DATA – Secret Constant Table Data Port	0x00000000	<a href="#">Section 12.2.64</a>

**Table 12.1 - Overview of SD Host Registers**

## 12.2 Register Details

### 12.2.1 SDH\_AUTO\_CMD23\_ARG2 – Auto CMD23 Argument 2 Register (address offset: 0x00)

This register sets a 32-bit block count to the argument of CMD23 while executing Auto CMD23. The available block count will be limited by BLK\_CNT. In this case, 65535 blocks are the maximum value.

Bit	Name	Type	Default Value	Description
31:0	ARG_2	RW	32'h0000_0000	Auto CMD23 argument 2

**Table 12.2 - 12.2.1 SDH\_AUTO\_CMD23\_ARG2 – Auto CMD23 Argument 2 Register**

### 12.2.2 SDH\_BLK\_SIZE – Block Size Register (address offset: 0x04)

This register is used to configure the number of bytes in a data block.

Bit	Name	Type	Default Value	Description
15:12	Reserved	-	-	-
11:0	BLK_SIZE	RW	12'h000	This register specifies the block size of data transfers for CMD17/18/24/25/53 and can be set with values ranging from 1 up to the maximum buffer size.

**Table 12.3 - 12.2.2 SDH\_BLK\_SIZE – Block Size Register**

### 12.2.3 SDH\_BLK\_COUNT – Block Count Register (address offset: 0x06)

The block count register is set when the BLK\_CNT\_EN bit is set to 1. This register is used only for the multi-block transfers. The host controller will decrease the counting number during the data transfer and stop counting when it counts down to zero. When a suspend command is completed in the SDIO transfer, the remaining block counts can be determined by reading this register. Before issuing a resume command to start a re-transfer, the host driver should restore the block counts that are previously saved.

Bit	Name	Type	Default Value	Description
31:16	BLK_CNT	RW	16'h000	Block count of the current transfer. Valid values are from 1 to 65535 blocks. 0000: stop counting

**Table 12.4 - 12.2.3 SDH\_BLK\_COUNT – Block Count Register**

### 12.2.4 SDH\_ARG\_1 – Argument 1 Register (address offset: 0x08)

This register is assigned to bits[39:8] of the command field.

Bit	Name	Type	Default Value	Description
31:0	ARG1	RW	32'h0000_0000	Command argument

**Table 12.5 - 12.2.4 SDH\_ARG\_1 – Argument 1 Register**

### 12.2.5 SDH\_TNSFER\_MODE – Transfer Mode Register (address offset: 0x0C)

The host driver should set this register before issuing the data transfer command or resume command. When in the SDIO transfer, the values of this register should be preserved after the suspend command and should be restored before the resume command.

Bit	Name	Type	Default Value	Description
15:6	Reserved	-	-	-
5	MULTI_BLK	RW	1'b0	1: Multiple blocks selection 0: Single block selection
4	TRAN_DIR_SEL	RW	1'b0	1: Read from the card to host 0: Write from the host to card
3:2	AUTO_CMD_EN	RW	2'h0	Auto CMD enable. There are two methods to stop the read and write operations of multiple blocks: 01: Auto CMD12 Enable When this field is set to 01, the host controller will issue a CMD12 when the last block transfer is completed. 10: Auto CMD23 Enable When this bit field is set to 10, the host controller will issue a CMD23 before issuing a command specified in the Command Register 11: Reserved 00: Auto Command Disabled
1	BLK_CNT_EN	RW	1'b0	Block count enable. This bit is only valid for a multi-block transfer. When set to 0 the BLK_CNT register will be disabled. The multi-block transfer will be an infinite transfer.
0	Reserved	RW	1'b0	Write 0 to this bit

**Table 12.6 - 11.2.5 SDH\_TNSFER\_MODE – Transfer Mode Register**

### 12.2.6 SDH\_CMD – Command Register (address offset: 0x0E)

The host driver should check the Command Inhibit (CMD) and Command Inhibit (DAT) bits in the present state register to determine whether the SD bus is free to transfer.

Bit	Name	Type	Default Value	Description		
31:30	Reserved	-	-	-		
29:24	CMD_IDX	RW	6'h00	Command Index These bits should be assigned to bits [45:40] of the command field		
23:22	CMD_TYPE	RW	2'h0	11	Abort	CMD12/52 for writing I/O Abort in CCCR
				10	Resume	CMD52 for writing Function Select in

Bit	Name	Type	Default Value	Description		
						CCCR
				01	Suspend	CMD52 for writing Bus Suspend in CCCR
				00	Normal	Other commands
21	DATA_PRE_SEL	RW	1'b0	Data Present Select 1: indicates that data is present and data transfer is enabled 0: under the following conditions <b>a.</b> Commands only using the CMD line <b>b.</b> Commands with no data transfer but using the busy signal on DAT[0] Resume command		
20	CMD_IDX_CHK_EN	RW	1'b0	Command Index Check Enable 1: the host controller will check the index field response to determine if the values are CMD_IDX. If they are not the same, CMD_IDX_ERR will be triggered		
19	CMD_CRC_CHK_EN	RW	1'b0	Command CRC Check Enable 1: the host controller will check the CRC field response to determine whether the CRC is correct. CMD_CRC_ERR will be triggered if an error is detected.		
18	Reserved	-	-	-		
17:16	RSP_TYPE_SEL	RW	2'h0	Response Type Select 11: Response length 48 with busy check after response 10: Response length 48 01: Response length 136 00: No response		

**Table 12.7 - 11.2.6 SDH\_CMD – Command Register**

### 12.2.7 SDH\_RESPONSE – Response Register (address offset: 0x10-0x1C)

The Host Controller stores the Auto CMD12 response in the upper word of the Response Register to avoid the Auto CMD12 response, which tends to be overwritten by the other command.

Bit	Name	Type	Default Value	Description
127:0	RSP	RO	0	Command Response

**Table 12.8 - 11.2.7 SDH\_RESPONSE – Response Register**

### 12.2.8 SDH\_BUF\_DATA – Buffer Data Port Register (address offset: 0x20)

This register uses the 32-bit Data Port Register to access the internal buffer.

Bit	Name	Type	Default Value	Description
31:0	DATA_PORT	RO	32'h0000_0000	Buffer Data Port Register

**Table 12.9 - 11.2.8 SDH\_BUF\_DATA – Buffer Data Port Register**

### 12.2.9 SDH\_PRESENT\_STATE – Present State Register (address offset: 0x24)

The host driver can access the status from this read-only register.

Bit	Name	Type	Default Value	Description
31:25	Reserved	-	-	-
24	CMD_LIN_LV	RO		Command Line Signal Level
23:20	DATA_LIN_LV	RO		Data[3:0] Line Signal Level
19	WR_PROP_LV	RO		Write Protect Pin Level 1: Write enabled 0: Write protected
18	CD_PIN_LV	RO		Card Detect Pin Level 1: Card is detected 0: Card is not detected
17	SYS_CARD_STABLE	RO		Card State Stable 1: No card or card is inserted 0: Reset or de-bounce
16	SYS_CARD_INSERT	RO		Card Inserted 1: Card inserted 0: Reset, de-bouncing, or no card is detected
15:12	Reserved	-	-	-
11	BUF_RD_EN	ROC		Buffer Read Enable 1: Read Enable 0: Read Disable
10	BUF_WR_EN	ROC		Buffer Write Enable 1: Write Enable 0: Write Disable
9	RD_TRAN_ACT	ROC		Read Transfer Active 1: under the following conditions: (1) After the end bit of a read command (2) When CONT_REQ in the block gap control register is set to restart a transfer. 0: under the following conditions: (1) When all data blocks specified by the block length are transferred to the system. (2) When SP_BLK_GAP in the block gap control register is set to 1 and the host controller has transferred all the valid data blocks to the system. The TRAN_CMPLT interrupt is generated when this bit changes from 1 to 0
8	WR_TRAN_ACT	ROC		Write Transfer Active 1: under the following conditions: (1) After the end bit of a write command (2) When CONT_REQ in the block gap control register is set to restart a transfer. 0: under the following conditions: (1) After getting the CRC status of the last data block specified by the transfer count.

Bit	Name	Type	Default Value	Description
				(2) After getting the CRC status of any block where data transmission is stopped by SP_BLK_GAP. A BLK_GAP_EVT interrupt will be generated when SP_BLK_GAP is set to 1 and this bit changes to 0. This bit is useful in the command with a busy data line.
7:3	Reserved	-	-	-
2	DATA_LIN_ACT	ROC		Data Line Active In a read transfer, this status bit is used to check whether a read transfer is executing on the bus. Changing this bit from 1 to 0 will generate a BLK_GAP_EVT interrupt when SP_BLK_GAP is set to 1. 1: under the following conditions: (1) After the end bit of a read command (2) When CONT_REQ in the block gap control register is set to restart a transfer. 0: under the following conditions: (1) When the end bit of the last data block is sent from the SD bus to the host controller. (2) When SP_BLK_GAP is set to 1 and a read transfer is stopped at the block gap. In a write transfer, this status bit is used to check whether a write transfer is executing on the bus. Changing this bit from 1 to 0 will generate a TRAN_CMPLT interrupt in the normal interrupt status register. 1: under the following conditions: (1) After the end bit of a read command (2) When CONT_REQ in the block gap control register is set to restart a transfer. 0: under the following conditions: (1) When the card releases the busy signal of the last data block. (2) When SP_BLK_GAP is set to 1 and the card releases the write busy at the block gap. In the command with busy data line, this bit indicates whether a command with busy is executing on the bus. This bit will be set after the end bit of the command with busy and will be cleared when busy is de-asserted or busy is not detected after the end of a response.
1	CMD_INHIBIT_DAT	ROC		Command Inhibit (DAT) 1: Cannot issue new commands to use the data line 0: Issue new commands to use the data line
0	CMD_INHIBIT_CMD	ROC		Command Inhibit (CMD) 1: Cannot issue command 0: Issue command only with the command line

**Table 12.10 - 11.2.9 SDH\_PRESENT\_STATE – Present State Register**

**12.2.10 SDH\_HST\_CNTL\_1 – Host Control 1 Register (address offset: 0x28)**

Bit	Name	Type	Default Value	Description
7	CD_SEL	RW	1'b0	Card Detect Signal Selection 1: The test level for the card detection 0: The card detect pin is selected
6	CD_TEST_LV	RW	1'b0	Card Detect Test Level 1: Card is inserted 0: Card cannot be found
5	EXT_DATA_WIDTH	RW	1'b0	Extended Data Transfer Width 1: 8-bit bus width 0: Bus width is selected by the data transfer width
4:2	Reserved	-	-	-
1	DATA_WIDTH	RW	1'b0	Data Width 1: 4-bit mode 0: 1-bit mode
0	Reserved	-	-	-

**Table 12.11 - SDH\_HST\_CNTL\_1 – Host Control 1 Register**
**12.2.11 SDH\_PWR\_CNTL – Power Control Register (address offset: 0x29)**

Bit	Name	Type	Default Value	Description
15:12	Reserved	-	-	-
11:9	SD_BUS_VOL	RW	3'h0	SD Bus Voltage Select 111: 3.3V (Typ) 110: 3.0V (Typ) 101: 1.8V (Typ) Others: Reserved
8	Reserved	-	-	-

**Table 12.12 - SDH\_PWR\_CNTL – Power Control Register**
**12.2.12 SDH\_BLK\_GAP\_CNTL – Block Gap Control Register (address offset: 0x2A)**

Bit	Name	Type	Default Value	Description
23:20	Reserved	-	-	-
19	INT_BLK_GAP	RW	1'b0	1: Check the interrupt at block gap enabled
18	READ_WAIT	RW	1'b0	1: Enable Read Wait
17	CONT_REQ	RWAC	1'b0	1: To restart a transaction (SP_BLK_GAP must also be 1; if 0 this will be aborted) It is cleared automatically by the host controller when: <ul style="list-style-type: none"> <li>a. In a read transfer, DATA_LIN_ACT changes from 0 to 1 to start a read transfer.</li> <li>b. In a write transfer, WR_TRAN_ACT changes from 0 to 1 to start a write transfer.</li> </ul>

16	SP_BLK_GAP	RW	1'b0	1: Stop at block gap request; the host controller will stop at the block gap by using READ_WAIT or stop IO_SD_CLK in a read transaction 0: the host controller will not write data to DATA_PORT
----	------------	----	------	--

**Table 12.13 - SDH\_BLK\_GAP\_CNTL – Block Gap Control Register**

#### 12.2.13 SDH\_CLK\_CNTL – Clock Control Register (address offset: 0x2C)

Bit	Name	Type	Default Value	Description
15:8	LOW_BIT_SD_CLK_SEL	RW	8'h00	SD clock frequency value 7:0 for the 10-bit divided clock mode. These are used to select the frequency of the IO_SD_CLK pin. The base clock is 1/2 of chip system clock. N: chip system clock * (1 / 2N) 0: not supported
7:6	UPPER_BIT_SD_CLK_SEL	RW	2'h0	SD clock frequency value 9:8 for the 10-bit divided clock mode
5	CLK_GEN_SEL	ROC	1'b0	This bit is always set to zero. 0: 10-bit divided clock mode
4:3	Reserved	-	-	-
2	SD_CLK_EN	RW	1'b0	1: IO_SD_CLK will be output
1	CLK_STABLE	ROC	1'b0	This bit is set to 1 when the internal clock is stable
0	INTER_CLK_EN	RW	1'b0	1: Internal clock will start oscillating

**Table 12.14 - SDH\_CLK\_CNTL – Clock Control Register**

#### 12.2.14 SDH\_TIMEOUT\_CNTL – Timeout Control Register (address offset: 0x2E)

This host driver should set the timeout value according to the capabilities register. The value of DATA\_TIMER indicates the data line timeout times.

Bit	Name	Type	Default Value	Description
23:20	Reserved	-	-	-
19:16	DATA_TIMER	RW	4'hE	1111: Reserved 1110: Chip system clk x 2^27 1101: Chip system clk x 2^26 ..... 0000: Chip system clk x 2^13

**Table 12.15 - SDH\_TIMEOUT\_CNTL – Timeout Control Register**

#### 12.2.15 SDH\_SW\_RST – Software Reset Register (address offset: 0x2F)

A reset pulse will be generated when this bit is set to 1. This bit will be automatically cleared once the reset pulse is issued.

Bit	Name	Type	Default Value	Description
31:27	Reserved	-	-	-
26	SOFT_RST_DAT	RWAC	1'b0	1: Software reset for data line
25	SOFT_RST_CMD	RWAC	1'b0	1: Software reset for command line
24	SOFT_RST_ALL	RWAC	1'b0	1: Software reset for all

**Table 12.16 - SDH\_SW\_RST - Software Reset Register**

**12.2.16 SDH\_NRML\_INT\_STATUS - Normal Interrupt Status Register (address offset: 0x30)**

The interrupt status can be latched by setting the Normal Interrupt Status Enable register corresponding bit to 1.

Bit	Name	Type	Default Value	Description
15	ERR_INT	ROC	1'b0	1: Error Interrupt
14:9	Reserved	-	-	-
8	CARD_INT	ROC	1'b0	1: Card Interrupt
7	CARD_REMOVE	RW1C	1'b0	1: Card Remove
6	CARD_INSERT	RW1C	1'b0	1: Card Inserted
5	BUF_RD_RDY	RW1C	1'b0	1: Buffer Read Ready
4	BUF_WR_RDY	RW1C	1'b0	1: Buffer Write Ready
3	Reserved	RW1C	1'b0	Write 0 to this bit
2	BLK_GAP_EVT	RW1C	1'b0	1: Block Gap Event
1	TRAN_CMPLT	RW1C	1'b0	1: Transfer Complete
0	CMD_CMPLT	RW1C	1'b0	1: Command Complete

**Table 12.17 - SDH\_NRML\_INT\_STATUS - Normal Interrupt Status Register**

**12.2.17 SDH\_ERR\_INT\_STATUS - Error Interrupt Status Register (address offset: 0x32)**

The interrupt status can be latched by setting the Error Interrupt Status Enable Register corresponding bit to 1.

Bit	Name	Type	Default Value	Description
31:27	Reserved	-	-	-
26	Reserved	RW1C	1'b0	Write 0 to this bit

Bit	Name	Type	Default Value	Description
25	Reserved	RW1C	1'b0	Write 0 to this bit
24	AUTO_CMD12_ERR	RW1C	1'b0	Auto CMD12 error
23	CUR_LIM_ERR	RW1C	1'b0	Current limit error
22	DATA_END_BIT_ERR	RW1C	1'b0	Data End Bit error
21	DATA_CRC_ERR	RW1C	1'b0	Data CRC error
20	DATA_TIMEOUT_ERR	RW1C	1'b0	Data Timeout error
19	CMD_IDX_ERR	RW1C	1'b0	Command Index error
18	CMD_ERR_BIT_ERR	RW1C	1'b0	Command End Bit error
17	CMD_CRC_ERR	RW1C	1'b0	Command CRC error
16	CMD_TIMEOUT_ERR	RW1C	1'b0	Command Timeout error

**Table 12.18 - 11.2.17 SDH\_ERR\_INT\_STATUS – Error Interrupt Status Register**

**12.2.18 SDH\_NRML\_INT\_ENABLE – Normal Interrupt Status Enable Register (address offset: 0x34)**

If the corresponding bit of the interrupt source in the normal interrupt status enable register is set to 1, the interrupt becomes active, which is latched and available for the host driver in the normal interrupt status register.

Bit	Name	Type	Default Value	Description
15	Reserved	-	-	-
14:9	Reserved	-	-	-
8	CARD_INT_ST_EN	RW	1'b0	Card Interrupt status enable
7	CARD_REMOVE_ST_EN	RW	1'b0	Card Remove status enable
6	CARD_INSERT_ST_EN	RW	1'b0	Card Insert status enable
5	BUF_RD_RDY_ST_EN	RW	1'b0	Buffer Read Ready status enable
4	BUF_WR_RDY_ST_EN	RW	1'b0	Buffer Write Ready status enable
3	Reserved	RW	1'b0	Write 0 to this bit
2	BLK_GAP_EVT_ST_EN	RW	1'b0	Block Gap Event status enable
1	TRAN_CMPLT_ST_EN	RW	1'b0	Transfer Complete status enable

0	CMD_CMPLT_ST_EN	RW	1'b0	Command Complete status enable
---	-----------------	----	------	--------------------------------

**Table 12.19 - SDH\_NRML\_INT\_ENABLE – Normal Interrupt Status Enable Register**

**12.2.19 SDH\_ERR\_INT\_ENABLE – Error Interrupt Status Enable Register (address offset: 0x36)**

If the corresponding bit of the interrupt source in the Error Interrupt Status Enable Register is set to 1 and if the interrupt becomes active, the active state will be latched and will be available for the host driver in this register.

Bit	Name	Type	Default Value	Description
31:26	Reserved	-	-	-
25	Reserved	RW	1'b0	Write 0 to this bit
24	AUTO_CMD12_ERR_ST_EN	RW	1'b0	Auto CMD12 error status enable
23	CUR_LIM_ERR_ST_EN	RW	1'b0	Current limit error status enable
22	DATA_END_BIT_ERR_ST_EN	RW	1'b0	Data End Bit error status enable
21	DATA_CRC_ERR_ST_EN	RW	1'b0	Data CRC error status enable
20	DATA_TIMEOUT_ERR_ST_EN	RW	1'b0	Data Timeout error status enable
19	CMD_IDX_ERR_ST_EN	RW	1'b0	Command Index error status enable
18	CMD_END_BIT_ERR_ST_EN	RW	1'b0	Command End Bit error status enable
17	CMD_CRC_ERR_ST_EN	RW	1'b0	Command CRC error status enable
16	CMD_TIMEOUT_ERR_ST_EN	RW	1'b0	Command Timeout error status enable

**Table 12.20 - SDH\_ERR\_INT\_ENABLE – Error Interrupt Status Enable Register**

**12.2.20 SDH\_NRML\_INT\_SGNL\_ENABLE – Normal Interrupt Signal Enable Register (address offset: 0x38)**

This register is used to select the interrupt status that is notified to the host system as an interrupt. These interrupt statuses share the same interrupt line.

Bit	Name	Type	Default Value	Description
15	Reserved	-	-	-
14:9	Reserved	-	-	-
8	CARD_INT_SIG_EN	RW	1'b0	Card Interrupt signal enable
7	CARD_REMOVE_SIG_EN	RW	1'b0	Card Remove signal enable

6	CARD_INSERT_SIG_EN	RW	1'b0	Card Insert signal enable
5	BUF_RD_RDY_SIG_EN	RW	1'b0	Buffer Read Ready signal enable
4	BUF_WR_RDY_SIG_EN	RW	1'b0	Buffer Write Ready signal enable
3	Reserved	RW	1'b0	Write 0 to this bit
2	BLK_GAP_EVT_SIG_EN	RW	1'b0	Block Gap Event signal enable
1	TRAN_CMPLT_SIG_EN	RW	1'b0	Transfer Complete signal enable
0	CMD_CMPLT_SIG_EN	RW	1'b0	Command Complete signal enable

**Table 12.21 - SDH\_NRML\_INT\_SGNL\_ENABLE – Normal Interrupt Signal Enable Register**

**12.2.21 SDH\_ERR\_INT\_SGNL\_ENABLE – Error Interrupt Signal Enable Register (address offset: 0x3A)**

This register is used to select the interrupt status that is regarded by the host system as an interrupt. These interrupt statuses share the same interrupt line.

Bit	Name	Type	Default Value	Description
31:26	Reserved	-	-	-
25	Reserved	RW	1'b0	Write 0 to this bit
24	AUTO_CMD12_ERR_SIG_EN	RW	1'b0	Auto CMD12 error signal enable
23	CUR_LIM_ERR_SIG_EN	RW	1'b0	Current limit error signal enable
22	DATA_END_BIT_ERR_SIG_EN	RW	1'b0	Data End Bit error signal enable
21	DATA_CRC_ERR_SIG_EN	RW	1'b0	Data CRC error signal enable
20	DATA_TIMEOUT_ERR_SIG_EN	RW	1'b0	Data Timeout error signal enable
19	CMD_IDX_ERR_SIG_EN	RW	1'b0	Command Index error signal enable
18	CMD_END_BIT_ERR_SIG_EN	RW	1'b0	Command End Bit error signal enable
17	CMD_CRC_ERR_SIG_EN	RW	1'b0	Command CRC error signal enable
16	CMD_TIMEOUT_ERR_SIG_EN	RW	1'b0	Command Timeout error signal enable

**Table 12.22 - SDH\_ERR\_INT\_SGNL\_ENABLE – Error Interrupt Signal Enable Register**

**12.2.22 SDH\_AUTO\_CMD12\_ERR\_STATUS – Auto CMD12 Error Status Register (address offset: 0x3C)**

When the auto\_cmd12\_en register is set to 1 and the auto cmd12 error status register is set, the host driver will check this register to identify what kind of error happens during executing AUTO CMD12. This register is valid only when the auto\_cmd12\_err is set to 1.

Bit	Name	Type	Default Value	Description
15:8	Reserved	-	-	-
7	CMD_NO_EX_BY_CMD12	ROC	1'b0	Command not executed by Auto CMD12 error
6:5	Reserved	-	-	-
4	AUTO_CMD_IDX_ERR	ROC	1'b0	Auto CMD index error
3	AUTO_CMD_END_BIT_ERR	ROC	1'b0	Auto CMD end bit error
2	AUTO_CMD_CRC_ERR	ROC	1'b0	Auto CMD CRC error
1	AUTO_CMD_TIMEOUT_ERR	ROC	1'b0	Auto CMD timeout error
0	AUTO_CMD12_NO_EX	ROC	1'b0	Auto CMD12 not executed

**Table 12.23 - SDH\_AUTO\_CMD12\_ERR\_STATUS – Auto CMD12 Error Status Register**

#### 12.2.23 SDH\_HOST\_CNTL\_2 – Host Control 2 Register (address offset: 0x3E)

Bit	Name	Type	Default Value	Description
31	PRESET_VAL_EN	RW	1'b0	0: SDCLK and driver strength are controlled by the host driver 1: automatic selection by the pre-set value
30	ASYN_INT_EN		1'b0	Asynchronous Interrupt Enable
29:24	Reserved	-	-	-
23	SAMPLE_CLK_SEL	RW	1'b0	Sampling clock select 0: Fixed clock is used to sample data
22:16	Reserved	-	-	-

**Table 12.24 - SDH\_HOST\_CNTL\_2 – Host Control 2 Register**

#### 12.2.24 SDH\_CAP\_1 – Capabilities Register 1 (address offset: 0x40)

The host controller may implement these values during initialization.

Bit	Name	Type	Default Value	Description
31:30	SLOT_TYPE	RO	2'h0	Removable Card Slot
29	ASYNC_INT_SUPPORT	RO	1'b0	0: not supported
28	BUT_64_SYPPORT	RO	1'b0	0: not supported
27	Reserved	-	-	-
26:25	Reserved	-	-	-

Bit	Name	Type	Default Value	Description
24	VOLTAGE_3_3_SUPPORT	RO	1'b1	Voltage supports 3.3V
23	SUSPEND_RESUME_SUPPORT	RO	1'b0	0: Suspend / Resume not supported
22	Reserved	RO	1'b1	-
21	HI_SPEED_SUPPORT	RO	1'b1	1: High speed supported
20	Reserved	RO	1'b0	-
19	Reserved	RO	1'b1	-
18	8BIT_SUPPORT	RO	1'b0	0: 8-bit not supported
17:16	MAX_BLK_LEN	RO	2'h2	2: 2048 bytes
15:8	BASE_CLK_FOR_SD_CLK	RO	8'h00	0: Get information via another method
7	TIMEOUT_CLK_UNIT	RO	1'b1	1: MHz
6	Reserved	-	-	-
5:0	TIMEOUT_CLK_FREQ	RO	6'h00	0: Get information via another method

**Table 12.25 - SDH\_CAP\_1 – Capabilities Register 1**
**12.2.25 SDH\_CAP\_2 – Capabilities Register 2 (address offset: 0x44)**

Bit	Name	Type	Default Value	Description
31:24	Reserved	-	-	-
23:16	CLK_MULTI	RO	8'h00	not supported
15:12	Reserved	-	-	-
11:8	Reserved	RO	4'hF	-
7	Reserved	-	-	-
6	DRIVER_D_SUPPORT	RO	1'b1	not supported
5	DRIVER_C_SUPPORT	RO	1'b1	not supported
4	DRIVER_A_SUPPORT	RO	1'b1	not supported
3	Reserved	-	-	-
2	DDR50_SUPPORT	RO	1'b1	not supported

Bit	Name	Type	Default Value	Description
1	SDR104_SUPPORT	RO	1'b0	not supported
0	SDR50_SUPPORT	RO	1'b1	not supported

**Table 12.26 - SDH\_CAP\_2 – Capabilities Register 2**

**12.2.26 SDH\_RSRV\_1 – Reserved 1 Register (address offset: 0x48)**

Bit	Name	Type	Default Value	Description
31:0	Reserved	-	-	-

**Table 12.27 - SDH\_RSRV\_1 – Reserved 1 Register**

**12.2.27 SDH\_RSRV\_2 – Reserved 2 Register (address offset: 0x4C)**

Bit	Name	Type	Default Value	Description
31:0	Reserved	-	-	-

**Table 12.28 - SDH\_RSRV\_2 – Reserved 2 Register**

**12.2.28 SDH\_FORCE\_EVT\_CMD\_ERR\_STATUS – Force Event Register for Auto CMD Error Status (address offset: 0x50)**

The Force Event register is not a physical register. It is an address to which the Auto CMD error status register can be written. The force event register is only for debugging.

Bit	Name	Type	Default Value	Description
15:8	Reserved	-	-	-
7	R_CMD_NO_EX_BY_CMD12	WO	1'b0	Force event for the Command Not Executed by Auto CMD12 Error
6:5	Reserved	-	-	-
4	R_CMD_IDX_ERR	WO	1'b0	Force event for the Auto CMD Index Error
3	R_CMD_END_BIT_ERR	WO	1'b0	Force event for the Auto CMD End Bit Error
2	R_CMD_CRC_ERR	WO	1'b0	Force event for the Auto CMD CRC Error
1	R_CMD_TIMEOUT_ERR	WO	1'b0	Force event for the Auto CMD Timeout Error
0	R_CMD12_NO_EX	WO	1'b0	Force event for the Auto CMD12 Not Executed

**Table 12.29 - SDH\_FORCE\_EVT\_CMD\_ERR\_STATUS – Force Event Register for Auto CMD Error Status**

**12.2.29 SDH\_FORCE\_EVT\_ERR\_INT\_STATUS – Force Event for Error Interrupt Status Register (address offset: 0x52)**

The Force Event register is not a physical register. It is an address to which the error interrupt status register can be written. This Force Event register is for debugging only. The effect of writing to this address will be reflected in the error interrupt status register if the corresponding bit of the error interrupt status enable register is set.

Bit	Name	Type	Default Value	Description
31:25	Reserved	-	-	Write 0 to these bits
24	R_AUTP_CMD_ERR	WO	1'b0	Force Event for the Auto CMD Error
23	R_CUR_LIMIT_ERR	WO	1'b0	Force Event for the Current Limit Error
22	R_DATA_END_BIT_ERR	WO	1'b0	Force Event for the Data End Bit Error
21	R_DATA_CRC_ERR	WO	1'b0	Force Event for the Data CRC Error
20	R_DATA_TIMEOUT_ERR	WO	1'b0	Force Event for the Data Timeout Error
19	R_CMD_IDX_ERR	WO	1'b0	Force Event for the Command Index Error
18	R_CMD_END_BIT_ERR	WO	1'b0	Force Event for the Command End Bit Error
17	R_CMD_CRC_ERR	WO	1'b0	Force Event for the Command CRC Error
16	R_CMD_TIMEOUT_ERR	WO	1'b0	Force Event for the Command Timeout Error

**Table 12.30 - SDH\_FORCE\_EVT\_ERR\_INT\_STATUS – Force Event for Error Interrupt Status Register**

**12.2.30 SDH\_RSRV\_3 – Reserved 3 Register (address offset: 0x54)**

## 13 UART

The device supports 2 UARTs with the following features:

- Software compatible with 16450 ("450"), 16550 ("550"), 16550A ("Extended 550"), 16650 ("650"), 16750 ("750") and 16C950 ("950") UARTs
- Separate configurable BAUD clock line
- Configuration capability
- Two modes of operation: UART mode and FIFO mode
- Majority voting logic
- 16 / 128 bytes FIFO for TX and RX in FIFO mode to reduce the interrupt frequency
- adds or deletes standard asynchronous communication bits (start, stop and parity) to or from the serial data
- Double buffering for both TX and RX in UART mode
- Independently controlled transmit, receive, line status and data set interrupts
- Programmable baud generator
- MODEM control functions (CTS, RTS, DSR, DTR, RI and DCD)
- Programmable automatic out-of-band Flow Control logic through Auto-RTS and Auto-CTS
- Programmable automatic Flow Control logic using DTR and DSR
- Programmable automatic in-band Flow Control logic using XON / XOFF characters
- Programmable special characters detection
- Trigger levels for TX and RX FIFO interrupts, automatic in-band and out-of-band flow control
- RS-485 buffer enable signals
- TX and RX disable capability
- Fully programmable serial interface characteristics:
  - 5-, 6-, 7-, 8- or 9-bit characters
  - Even, odd, or no-parity bit generation and detection
  - 1-, 1.5, or 2-stop bit generation
  - Baud generation
  - Detection of bad data in receive FIFO
- Clock prescaler from 1 to 31875
- Enhanced isochronous clock option

- Complete status reporting capabilities
- False start bit detection
- Line-break generation and detection. Internal diagnostic capabilities:
  - Loop-back controls for communications link fault isolation
  - Break, parity, overrun, framing error simulation
- Full prioritised interrupt system controls
- Software reset

## 13.1 Register Summary

The registers offset from the base addresses are 0x10320 for UART 1 and 0x10330 for UART 2. All registers can only be accessed via Byte (8-bit) mode.

**Table 13.1 - Overview of UART Registers**

## 13.2 UART MODE SELECTION

The operation of the UART depends on a number of standard mode settings. These modes are referred to throughout this section. The compatibility modes are tabulated below.

UART Mode	FIFO Size	FCR(0)	Enhanced Mode EFR(4) = 1	FCR(5) Guarded with LCR(7) = 1	FIFOSEL
450	1	0	X	X	X
550	16	1	0	0	0
Extended 550	128	1	0	X	1
650	128	1	1	X	X
750	128	1	0	1	0
950	128	1	1	X	X

**Table 13.2 - UART mode selection**

### 450 Mode

The 450 mode is the default mode set after a hardware reset. In the 450 Mode the FIFO is disabled, and the UART operates in BYTE mode. With FCR[0] cleared, (FIFO disabled) all other mode setting are ignored.

### 550 Mode

In the 550 mode the FIFO's are enabled, and can accept up to 16 bytes of data (reception and transmission directions). To put the UART into 550 mode, the FCR[0] should be set high. In this mode the FIFOSEL pin should be tied low.

### Extended 550 Mode

The extended 550 mode is enabled by connection of the FIFOSEL to a HIGH state. In this mode the FIFO size is increased to 128 bytes.

### 750 Mode

The 750 mode is enabled by writing the FCR[0] with 1 and FCR[5] with 1. In the 750 mode the FIFO size is set to 128 bytes. Please note, that writes to FCR[5] are protected by FCR[7]. To write FCR[5], first set the FCR[7] high, then write FCR[5], and clear FCR[7] back to activate protection. In the 750 mode the FIFOSEL pin should be tied low (0).

750 mode enhancements over 550 mode:

- Deeper FIFO size
- Automatic RTS/CTS out-of-band flow control
- Sleep mode

## 650 Mode

The 650 mode is active when EFR[4] is set (enhanced mode is enabled). As 650 software drivers usually put the device into enhanced mode, running 650 drivers on the UART device will result in 650 compatibilities with 128 deep FIFO's, as long as FCR[0] is set.

The FIFOSEL state is ignored in the 650 mode.

The 650 mode enhancements over 550 mode:

- Deeper FIFO size
- Automatic RTS/CTS out-of-band flow control
- Sleep mode
- Automatic in-band flow control
- Special character detection
- IRDA-format transmit and receive mode
- Transmit trigger levels
- Optional clock prescaler

## 950 Mode

The additional features of 950 mode apply only when UART is in Enhanced mode (EFR[4] = 1). FCR[0] set in Enhanced mode enables the 128 Bytes FIFO mode.

Configuration of the UART in 950 Mode is identical with the 650 Mode. Additional specific features of 950 Mode's, are enabled using the Additional Control Register ACR. In addition to larger FIFO's, higher baud rates the enhancements of 950 over 650 mode are:

- Selectable arbitrary trigger levels for the receiver and transmitter FIFO interrupts
- Improved automatic flow control using selectable arbitrary thresholds
- DSR/DTR automatic flow control
- Transmitter and receiver can be optionally disabled
- Software reset of device
- Readable FIFO fill levels
- Optional generation of an RS-485 buffer enable signal
- Four-byte device identification
- Readable status for automatic in-band and out-of-band flow control
- External 1x clock modes
- Flexible M N/8 clock prescaler
- 9-bit data mode

The 950 trigger levels are enabled when ACR[5] is set (FCR[7:4] are ignored). The arbitrary trigger levels can be defined in RTL, TTL, FCL and FCH registers. The Additional Status Register (ASR) offers flow control status for the local and remote transmitters. FIFO levels are readable using RFL and TFL registers.

The user may apply an external 1x (or Nx) clock for the transmitter and receiver to the RI and DSR pin respectively. The transmitter clock may be asserted on the DTR pin. The external clock options are selected through the CKS register.

It is also possible to define the over-sampling rate used by the transmitter and receiver clocks. The 450/550/750 and compatible devices employ 16 times over-sampling. There are 16 clock cycles per bit. The UART can employ over-sampling rate from 4 to 16 by programming the TCR register. This allows the data rates to be increased. Default value after reset for this register is 0x00, which corresponds to a 16-cycle sampling clock. Writing 0x01, 0x02 or 0x03 will also result in 16 cycle sampling clock. To program the value to any value from 4 to 15 it is necessary to write this value into TCR, to set the device to a 13-cycle sampling clock it would be necessary to write 0x0D to TCR.

The UART also offers 9-bit data frames for multi-drop industrial applications.

## 13.3 STANDARD 550 COMPATIBLE REGISTERS

### 13.3.1 UART\_RBR - Receiver Buffer Register (address offset: 0x00 and LCR[7] = 0)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	FIFO Data Read from RX Buffer

**Table 13.3 - UART\_RBR - Receiver Buffer Register**

### 13.3.2 UART\_THR - Transmitter Holding Register (address offset: 0x00 and LCR[7] = 0)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	FIFO Data Write to TX Buffer

**Table 13.4 - UART\_THR - Transmitter Holding Register**

### 13.3.3 UART\_DIV\_LSB - Divisor LSB Register (address offset: 0x00 and LCR[7] = 1)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	The 8 least-significant bits (LSBs) of the 16-bit divisor for generation of the baud clock in the baud rate generator. BaudRate = InputClock/ (SC * Divisor * prescaler)

**Table 13.5 - UART\_DIV\_LSB - Divisor LSB Register**

### 13.3.4 UART\_DIV\_MSB - Divisor MSB Register (address offset: 0x01 and LCR[7] = 1)

Bit	Name	Type	Default Value	Description
7:0	DATA	WO	8'h00	The 8 most-significant bits (MSBs) of the 16-bit divisor for generation of the baud clock in the baud rate generator. BaudRate = InputClock/ (SC * Divisor * prescaler)

**Table 13.6 - UART\_DIV\_MSB - Divisor MSB Register**

### 13.3.5 UART\_INT\_ENABLE - Interrupt Enable Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	CTS_EN	RW	1'h0	Enable CTS interrupt when EFR[4] = 1
6	RTS_EN	RW	1'h0	Enable RTS interrupt (when EFR[4]=1)
5	SC_EN	RW	1'h0	Enable Special Character interrupt Mask or Alternate Sleep Mode
4	SM_EN	RW	1'h0	Enable Sleep Mode
3	MOD_STS_EN	RW	1'h0	Enable Modem Status Interrupt

2	LINE_STS_EN	RW	1'h0	Enable Receiver Line Status Interrupt
1	TX_EMTPY_EN	RW	1'h0	Enable Transmitter Holding Register Empty Interrupt
0	RX_AVL_EN	RW	1'h0	Enable Received Data Available Interrupt

**Table 13.7 - UART\_INT\_ENABLE - Interrupt Enable Register**

### 13.3.6 UART\_INT\_STATUS - Interrupt Status Register (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	Reserved
5:4	Interrupt priority (Enhanced mode)	RO	2'h0	Refer to Table 13.9 below.
3:1	Interrupt priority (All modes)	RO	3'h0	Refer to Table 13.9 below.
0	Interrupt pending	RO	1'h0	Refer to Table 13.9 below.

**Table 13.8 - UART\_INT\_STATUS - Interrupt Status Register**

In order to provide minimum software overhead during data character transfers, the UART prioritizes interrupts into six levels and records these in the interrupt Status Register. When the CPU accesses the Interrupt status register, the UART freezes all interrupts and indicates the highest priority pending interrupt to the CPU. While this CPU access is occurring, the UART records new interrupt, but do not change its current indication until the access is complete. The table below shows the contents of the Interrupt Status Register.

UART_INT_STATUS [5:0]	Interrupt Function		
	INT TYPE	INT Source	Level
000001	none	No interrupt pending1	-
000110	Receiver Line Status or address-bit detected in 9-bit mode	Overrun Error or Parity Error or Framing Error or Break Interrupt or address-bit detected in 9-bit mode	1
000100	Receiver Data Available	The receiver FIFO level is above the interrupt trigger level	2a
001100	Receiver time-out	There has been no read of UART_RBR or a period of time greater than the time-out period. There has been no new data received and written into the UART_RBR for a period of time greater than the time-out period.	2b
000010	Transmitter THR empty	Transmitter Holding Register Empty	3
000000	Modem status change	Clear to Send or Data Set Ready or Ring Indicator or Data Carrier Detect	4
010000	In-band flow control XOFF or special character (XOFF2) or special character 1,2,3 or 4 or bit 9	Valid XOFF, valid XOFF2 or matches special character 1,2,3 or 4 (only in Enhanced mode)	5

<b>UART_INT_S TATUS [5:0]</b>	<b>Interrupt Function</b>		
	<b>INT TYPE</b>	<b>INT Source</b>	<b>Level</b>
	set in 9-bit mode		
100000	CTS or RTS change of state	When CTS or RTS bits will change	6

**Table 13.9 - Interrupt Status Register Software Handling**

**Notes:**

- 1 - ISR[0] indicates whether any interrupts are pending.
- 2 - Interrupts of priority levels 5 and 6 cannot occur unless the UART is in Enhanced mode
- 3 - ISR[5] is only used in 650 & 950 modes. In 750 mode, it is 0 when FIFO size is 16 and 1 when FIFO size is 128. In all other modes it is permanently set to 0.

### 13.3.7 UART\_FCR - FIFO Control Register (address offset: 0x02)

#### 550 AND 750 MODE

<b>Bit</b>	<b>Name</b>	<b>Type</b>	<b>Default Value</b>	<b>Description</b>
7:6	RCVR_TRIG	WO	2'h0	Receiver FIFO Trigger
5	FIFO_SIZE	WO	1'h0	Enable UART support for 128 Byte deep FIFO's
4:3	Reserved	WO	2'h0	
2	TXMT_RST	WO	1'h0	Transmitter FIFO reset. Writing a 1 to FCR2 clears all bytes in the XMIT FIFO and resets its counter logic to 0. The shift register is not cleared. The 1 that is written to this bit position is self-clearing.
1	RCVR_RST	WO	1'h0	Receiver FIFO reset. Writing a 1 to FCR1 clears all bytes in the RCVR FIFO and resets its counter logic to 0. The shift register is not cleared. The 1 that is written to this bit position is self-clearing.
0	FIFO_EN	WO	1'h0	Receiver and Transmitter FIFO's enable.

**Table 13.10 - UART\_FCR - FIFO Control Register – 550 mode**

This is a write only register at the same location as the ISR (the ISR is a read only register). Readable contents of this register are placed in ICR space on 0x0F offset. This register is used to enable the FIFOs, clear the FIFOs, set the FIFO triggers levels, and select the type of DMA signaling. When changing from the FIFO Mode to UART Mode and vice versa, data is automatically cleared from the FIFOs. This bit must be a 1 when other FCR bits are written to or they will not be programmed.

RCVR TRGIGG(1:0) - are used to set the trigger level for the RCVR FIFO interrupt.

Fcr[7:6]	<b>RCVR FIFO TRIGGER LEVEL</b>	
	<b>Standard FIFO*mode (16 B)</b>	<b>Extended FIFO*mode*(128B)</b>
00	1	1
01	4	32
10	8	64
11	14	112

**Table 13.11 - UART\_RCVR - FIFO Trigger Level – 550 mode**

\* - depends on Ext FIFO enable (FCR(5)) bit value

In this mode the transmitter trigger level is equal to 1.

## 650 MODE

<b>Bit</b>	<b>Name</b>	<b>Type</b>	<b>Default Value</b>	<b>Description</b>
7:6	RCVR_TRIG	WO	2'h0	Receiver FIFO Trigger
5:4	THR_TRIG	WO	1'h0	Transmitter FIFO Trigger
3	Reserved	-	2'h0	-
2	TXMT_RST	WO	1'h0	Transmitter FIFO reset. Writing a 1 to FCR2 clears all bytes in the XMIT FIFO and resets its counter logic to 0. The shift register is not cleared. The 1 that is written to this bit position is self-clearing
1	RCVR_RST	WO	1'h0	Receiver FIFO reset. Writing a 1 to FCR1 clears all bytes in the RCVR FIFO and resets its counter logic to 0. The shift register is not cleared. The 1 that is written to this bit position is self-clearing
0	FIFO_EN	WO	1'h0	Receiver and Transmitter FIFO's enable

**Table 13.12 - UART FCR - FIFO Control Register – 650 mode**

This is a write only register at the same location as the ISR (the ISR is a read only register). This register is used to enable the FIFOs, clear the FIFOs, set the RCVR FIFO and THR FIFO triggers level, and select the type of DMA signaling. When changing from the FIFO Mode to UART Mode and vice versa, data is automatically cleared from the FIFOs. This bit must be a 1 when other FCR bits are written to or they will not be programmed.

RCVR TRGIGG(1:0) - are used to set the trigger level for the RCVR FIFO interrupt and flow control.

FCR[7:6]	RCVR FIFO TRIGGER LEVEL	
	Lower trigger for flow control	Interrupt trigger and upper trigger for flow control
00	1	16
01	16	32
10	32	112
11	112	120

**Table 13.13 - UART\_RCVR - FIFO Trigger Level – 650 mode**

THR TRIG(1:0) - are used to set the trigger level for the XMIT FIFO interrupt.

FCR[5:4]	TRANSMIT INTERRUPT TRIGGER LEVEL
00	16
01	32
10	64
11	112

**Table 13.14 - XMIT FIFO Trigger Level**

### 950 MODE

When ACR[5]=1, bits FCR[5:4] and FCR[7:6] are ignored and the transmitter trigger level can be defined by TTL(transmitter) and RTL(receiver) registers. The trigger level determined by TTL and RTL may be from 0 to 127. There are also FCH and FCL registers used for specifying triggers for the flow control feature.

Setting 0x00 to the TTL register causes an interrupt to occur when the FIFO and the transmitter shift register are both empty and the SO is in idle state.

#### 13.3.8 UART\_LCR - Line Control Register (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7	DLA	RW	1'h0	Divisor Latch Access Bit 0: Receiver and Transmitter Buffers enable 1: Divisor Latch Enable
6	SET_BRK	RW	1'h0	When set the transmitter is switched into break state, The SO Serial Output pin is driven into logic 0 state
5	SET_PARITY	RW	1'h0	Stick Parity 0: Disable Parity Stick 1: Enable Parity Stick
				When bits 3, 4 and 5 are logic 1 the Parity bit is transmitted and checked as a logic 0. If bits 3 and 5 are 1 and bit 4 is a logic 0 then the Parity bit is transmitted and checked as a logic 1. If bit 5 is a logic 0 Stick Parity is disabled.
4	EVEN_PARITY	RW	1'h0	Even Parity Select 0: An odd number of logic ones is checked for in the transmitted and received character 1: An even number of logic ones is checked for in the transmitted and received character
3	PARITY_EN	RW	1'h0	Parity Enable 1: parity enabled

Bit	Name	Type	Default Value	Description
				0: parity disabled
2	STOP_BITS	RW	1'h0	Number of STOP bits 0: 1 Stop bit generated 1: 1.5 stop bits generated for 5 data bits or 2 STOP bits generated for 6/7/8 data bits
1:0	WORD_LEN	RW	2'h0	Word Length select bits 00: 5 data bits 01: 6 data bits 10: 7 data bits 11: 8 data bits

**Table 13.15 - UART\_LCR - Line Control Register**

### 13.3.9 UART\_MCR - Modem Control Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7	BAUD_PSCL*	RW	1'h0	Baud rate prescaler select Writing a 0 to this bit sets the clock divider in the baud generator to 1, else the divider is a M where: M=CPR[7:3].
6	IRDA_MODE*	RW	1'h0	IrDA mode This bit is only available in 650 or 950 modes. A '1' on this bit enables IrDA mode, which transfers received and transmitted data in special format.
5	AFE_XON*	RW	1'h0	XON-any disabled/enabled. Auto Flow Control enable 1: auto flow control enabled 0: disable auto flow control In Enhanced mode this bit is used for enabling the "XON any" feature. This feature allows re-enabling transmission in case of receiving any character in Automatic In-band Flow Control mode
				AFE BIT(5)      RTS BIT(1)      FLOW CONFIGURATION
				1      1      Auto-RTS and Auto-CTS enabled
				1      0      Auto-CTS only enabled
				0      -      Both Auto-RTS and Auto-CTS disabled
4	LOOPBK_EN	RW	1'h0	Enable Loopback bit 1: This bit provides a local loop-back feature for diagnostic testing of the UART
3	OUT2	RW	1'h0	Output 2 (OUT2) 1: the OUT2 output is forced to a logic 0 0: the OUT2 output is forced to a logic 1
2	OUT1	RW	1'h0	Output1 (OUT1) 1: the OUT1 output is forced to a logic 0

				0: the OUT1 output is forced to a logic 1
1	RTS	RW	1'h0	Request to send 1: the RTS output is forced to a logic 0 0: the RTS output is forced to a logic 1
0	DTR	RW	1'h0	Data Terminal Ready 1: the DTR output is forced to a logic 0 0: the DTR output is forced to a logic 1

**Table 13.16 - UART\_MCR - Modem Control Register**

\* – Note only 650/950 mode

### 13.3.10 UART\_LSR - Line Status Register (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7	RBR_ERR	RO	1'h0	Error in UART_RBR / Error in RCVR FIFO In the UART Mode this is a 0. In the FIFO mode, 1: when there is at least one parity error, framing error or break indication in the FIFO. 0: when LSR is read. In 450 mode this bit is permanently cleared. In 9-bit mode this bit is not affected by LSR[2].
6	TX_EMTPY	RO	1'h0	Transmitter Empty 1: whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register are both empty. 0: whenever either the THR or TSR contains a data character. In the FIFO mode 1: whenever the transmitter FIFO and shift register are both empty
5	TXH_EMTPY	RO	1'h0	Transmitter Holding Register Empty 1: Transmitter Holding Register is Empty 0: Transmitter Holding Register has data In the FIFO mode, 1: XMIT FIFO is empty 0: at least 1 byte is written to the XMIT FIFO
4	BRK_INT	RO	1'h0	Break Interrupt 1: whenever the received data input is held in the Space (logic 0) state for longer than a full word transmission time (that is, the total time of Start bit, data bits, a Parity and Stop bits). 0: whenever the CPU reads the contents of the Line Status Register. In the FIFO mode this error is associated with the particular character in the FIFO it applies to. This error is revealed to the CPU when its associated character is at the top of the FIFO. When break occurs only one zero character is loaded into the FIFO. The next character transfer is enabled after SI goes to the mark state and receives the next valid start bit.
3	FRM_ERR	RO	1'h0	Framing Error indicates that the received character did not have a valid Stop bit. 1: whenever the Stop bit following the last data bit or

Bit	Name	Type	Default Value	Description
				<p>parity bit is detected as a logic 0 bit (Spacing level).            0: whenever the CPU reads the contents of the Line Status Register.</p> <p>In the FIFO mode this error is associated with the particular character in the FIFO it applies to. This error is revealed to the CPU when its associated character is at the top of the FIFO. The UART will try to resynchronize after a framing error.</p>
2	PRTY_ERR_RX_9BIT	RO	1'h0	<p>Parity Error/ 9-bit of received data in UART-RBR            1: upon detection of a parity error            0: whenever the CPU reads the contents of the Line Status Register.</p> <p>In the FIFO mode this error is associated with the particular character in the FIFO it applies to. This error is revealed to the CPU when its associated character is at the top of the FIFO.</p> <p>In 9-bit mode, this bit is the 9-th bit of the received data, in addition to the 8 bits in UART-RBR.</p>
1	OVRN_ERR	RO	1'h0	<p>Overrun Error            1: upon detection of an overrun condition and reset whenever the CPU reads the contents of the Line Status Register. If the FIFO mode data continues to fill the FIFO beyond the trigger level, an overrun error will occur only after the FIFO is full and the next character has been completely received in the shift register. OVRN_ERR is indicated to CPU as soon as it happens. The character in the shift register is overwritten, but it is not transferred to the FIFO.</p>
0	DATA_RDY	RO	1'h0	<p>Data Ready            1: whenever a complete incoming character has been received and transferred into the Receiver Buffer Register or the FIFO.            0: by reading all of the data in the Receiver Buffer Register or the FIFO</p>

**Table 13.17 - UART\_LSR - Line Status Register**
**13.3.11 UART\_MSR - Modem Status Register (address offset: 0x06)**

Bit	Name	Type	Default Value	Description
7	DCD	RO	1'h0	<p>Data Carrier Detect            This bit is the complement of the Data Carrier Detect (DCD) input. If bit 4 of the Modem Control Register is set to a 1, this bit is equivalent to OUT 2 in the Modem Control Register.</p>
6	RI	RO	1'h0	<p>Ring Indicator            This bit is the complement of the Ring Indicator (RI) input. If bit 4 of the Modem Control Register is set to a 1, this bit is equivalent to OUT 1 in the Modem Control Register.</p>
5	DSR	RO	1'h0	<p>Data Set Ready            This bit is the complement of the Data Set Ready (DSR) input.            If bit 4 of the Modem Control Register is set to a 1, this bit</p>

Bit	Name	Type	Default Value	Description
				is equivalent to DTR in the Modem Control Register.
4	CTS	RO	1'h0	Clear to Send This bit is the complement of the Clear to Send (CTS) input. If bit 4 (LOOPBK_EN) of the Modem control register is set to a 1, this bit is equivalent to RTS in the Modem Control Register.
3	D_DCD	RO	1'h0	Delta Data Carrier Detect 1: indicates that the DCD input to the chip has changed state.
2	TERI	RO	1'h0	Trailing Edge Ring Indicator 1: Indicates that the RI input to the chip has changed from a low to a high state.
1	D_DSR	RO	1'h0	Delta Data Set ready 1: Indicates that the DSR input to the chip has changed state since the last time it was read by the CPU.
0	D_CTS	RO	1'h0	Delta Clear To Send 1: Indicates that the CTS input to the chip have changed state since the last time it was read by the CPU.

**Table 13.18 - UART\_MSR - Modem Status Register**

#### 13.3.12 UART\_SPR - SPR Register (address offset: 0x07)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	This is the command port for the indexed control register. Writing and reading to indexed control register is addressed by offset written to this register

**Table 13.19 - UART\_SPR - SPR Register**

## 13.4 650 COMPATIBLE REGISTERS

To access these registers LCR must be set to 0xBF.

#### 13.4.1 UART\_EFR - Enhanced Feature Register (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7	CTS_FC	RO	1'h0	1: Automatic CTS flow control enable
6	RTS_FC	RO	1'h0	1: Automatic RTS flow control enable
5	SPL_CHAR	RO	1'h0	1: Special Character Detection mode enable
4	EM	RO	1'h0	1: Enhanced mode enable

3:2	IBT_FCM	RO	1'h0	In-band transmit flow control mode 00: Disable in-band flow control 01: Enable single character in-band transmit flow control. Recognizing XON2 as the XON character and XOFF2 as the XOFF character 10: Enable single character in-band transmit flow control. Recognizing XON1 as the XON character and XOFF1 as the XOFF character 11: Reserved
1:0	IBR_FCM	RO	1'h0	In-band receive flow control mode 00: Disable in-band flow control 01: Enable single character in-band receive flow control. Recognizing XON2 as the XON character and XOFF2 as the XOFF character 10: Enable single character in-band receive flow control. Recognizing XON1 as the XON character and XOFF1 as the XOFF character 11: Reserved

**Table 13.20 - UART\_EFR - Enhanced Feature Register**

#### 13.4.2 UART\_XON1 - XON1 Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7:0	DATA		8'h00	Value of XON1

**Table 13.21 - UART\_XON1 - XON1 Register**

#### 13.4.3 UART\_XON2 - XON2 Register (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7:0	DATA		8'h00	Value of XON2

**Table 13.22 - UART\_XON2 - XON2 Register**

#### 13.4.4 UART\_XOFF1 - XOFF1 Register (address offset: 0x06)

Bit	Name	Type	Default Value	Description
7:0	DATA		8'h00	Value of XOFF1

**Table 13.23 - UART\_XOFF1 - XOFF1 Register**

#### 13.4.5 UART\_XOFF2 - XOFF2 Register (address offset: 0x07)

Bit	Name	Type	Default Value	Description
7:0	DATA		8'h00	Value of XOFF2

**Table 13.24 - UART\_XOFF2 - XOFF2 Register**

## 13.5 950 COMPATIBLE REGISTERS

To access these registers ACR[7] must be set to 1.

### 13.5.1 UART\_ASР - Additional Status Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	TX_IDLE	RO	1'h0	1: transmitter is idle (transmitter FIFO and shift register are empty) 0: transmitter is transmitting.
6	FIFO_SIZE	RO	1'h0	1: FIFO are 16 deep if FCR[0]=1; 0: FIFO are 128 deep if FCR[0]=1
5	FIFO_SEL	RO	1'h0	Actual state of FIFOSEL pin
4	SPECIAL_CHAR_DETECT	RO	1'h0	1: special character detect and is stored in UART_RBR; 0: no special character detect The flag is cleared by reading ASR.
3	DTR	RO	1'h0	Complement state of DTR pin
2	RTS	RO	1'h0	Complement state of the RTS pin
1	REMOTE_TX_DSBL	RW	1'h0	1: transmitter has sent an XOFF character 0: the remote transmitter is not disabled by in-band flow control. This bit may be cleared by software to re-enable remote transmitter (XON is sent).
0	TX_DSBL	RW	1'h0	1: transmitter disabled (receiver detect XOFF) 0: transmitter is not disabled by in-band flow control. This bit may be cleared by software to re-enable transmission if it was disabled by in-band flow control.

**Table 13.25 - UART\_ASР - Additional Status Register**

### 13.5.2 UART\_RFL - Receiver FIFO Level Register (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	Number of characters in the receiver FIFO

**Table 13.26 - UART\_RFL - Receiver FIFO Level Register**

**Note:** Reading from this register requires ACR[7]=1

### 13.5.3 UART\_TFL - Transmitter FIFO Level Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	Number of characters in the transmitter FIFO

**Table 13.27 - UART\_TFL - Transmitter FIFO Level Register**

**Note:** Reading from this register requires that last value written to LCR was not 0xBF and ACR[7]=1

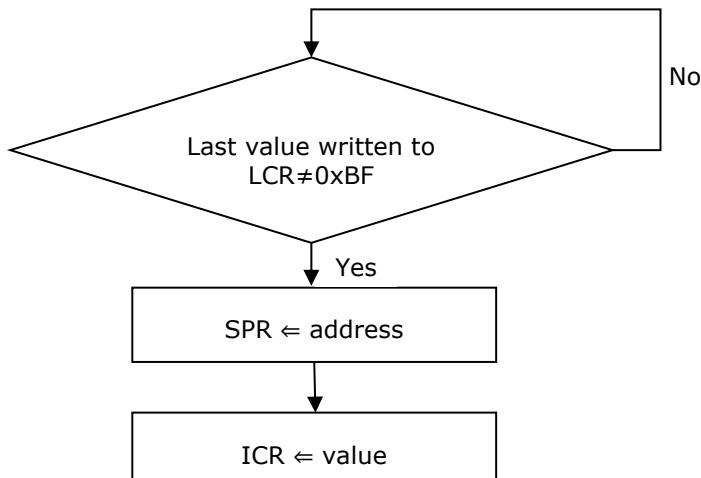

#### 13.5.4 UART\_ICR - ICR Register (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	Data port to the indexed control register. Writing data to the indexed control register and reading data from the indexed control register is done using this register.

**Table 13.28 - UART\_ICR - ICR Register**

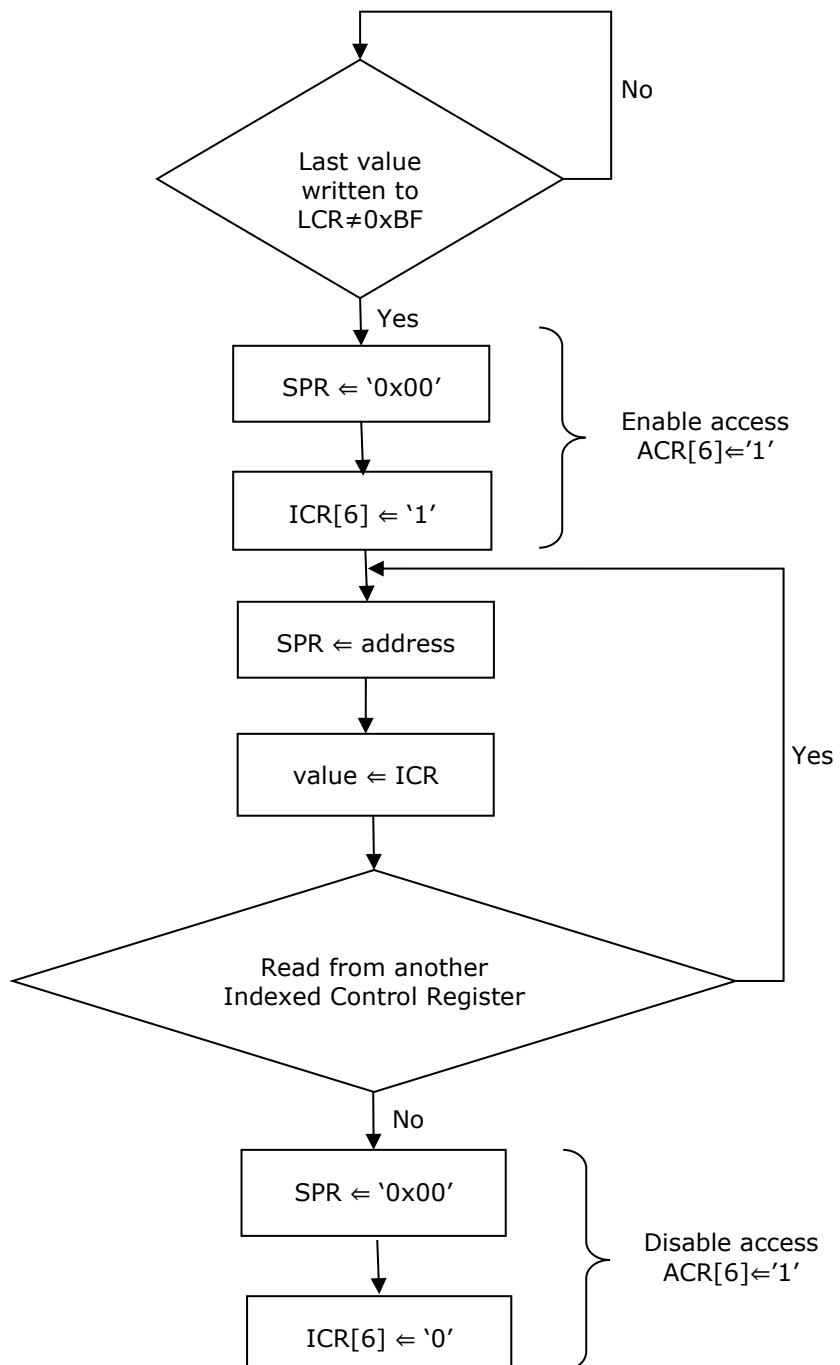

## 13.6 INDEXED CONTROL REGISTERS

Writing to Indexed Control Registers (ICRs) is addressed by the SPR offset, and data is loaded through the ICR register. Before writing, be sure that the LCR was not loaded with value '0xBF' (it enables access to 650 compatible registers). To write ICRs, please follow these steps:

**Figure 13.1 - ICR registers write access**

Reading from Indexed Control Registers is addressed by the SPR offset, and data is read through the ICR register. Before reading be sure that LCR was not loaded with the value '0xBF' (it enables access to 650 compatible registers). To read from ICRs, please follow these steps:

**Figure 13.2 - ICR registers read access**

**13.6.1 UART\_ACR - Additional Control Register (SPR offset: 0x00)**

Bit	Name	Type	Default Value	Description
7	ADL_STS_EN	RW	1'h0	Additional status enable 1: ASR, TFL and RFL are enabled 0: disabled
6	ICR_RD_EN	RW	1'h0	ICR read enable 0: LSR is readable 1: ICR registers are readable
5	950_TLE	RW	1'h0	0: Interrupts and flow control trigger levels are described in the FCR register 1: The triggers are set by RTL, TTL, FCL and FCH registers
4:3	DTR	RW	1'h0	DTR line configuration When CKS[4] or CKS[5] are set, the transmitter 1x clock or the output of the baud rate generator (Nx clock) are asserted on the DTR pin, otherwise the pin is defined as follows:  00: DTR pin is compatible with 450, 550, 650 and 750 (i.e. normal).  01: DTR pin is used for out-of-band flow control. It will be forced high, when the receiver FIFO level reaches the upper flow control trigger (FCH). It will be forced low when the receiver FIFO level falls below the lower flow control trigger (FCL).  10: DTR is configured to drive the active low enable pin of an external RS485 buffer. The pin will be forced low whenever the transmitter is not empty (LSR[6]=0), otherwise the pin is high.  11: DTR is configured to drive the active high enable pin of the external RS485 buffer. The pin will be forced high whenever the transmitter is not empty (LSR[6]=0), otherwise the pin is low.
2	DSR	RW	1'h0	1: enables automatic out-of-band flow control using the DSR pin
1	TX	RW	1'h0	Transmitter disable. 0: Transmitter is enabled. 1: Transmitter is disabled. Data in THR are not transmitted. In-band flow control characters may still be transmitted.
0	RX	RW	1'h0	Receiver disable. 0: Receiver is enabled and data are stored in UART_RBR. 1: Receiver is disabled. The receiver continues to operate as normal to maintain frame synchronization but received data are not stored. In-band control characters continue to be detected and acted upon. Special characters will not be detected.

**Table 13.29 - UART\_ACR- Additional Control Register**

### 13.6.2 UART\_CPR - Clock Prescaler Register (SPR offset: 0x01)

Bit	Name	Type	Default Value	Description
7:3	PSCL	RW	5'h00	Clock prescaler
2:0	Reserved	-	-	-

**Table 13.30 - UART\_CPR - Clock Prescaler Register**

### 13.6.3 UART\_TCR - Time Clock Register (SPR offset: 0x02)

Bit	Name	Type	Default Value	Description
7:4	Reserved	-	-	-
3:0	N_TIMES_CLOCK	RW	4'h00	Bits N-times clock

**Table 13.31 - UART\_TCR - Time Clock Register**

### 13.6.4 UART\_CKS Clock Select Register (SPR offset: 0x03)

Bit	Name	Type	Default Value	Description
7	TX_CLK_MD	RW	1'h0	Transmitter 1x clock mode selector 0: transmitter clock is in Nx clock mode 1: transmitter is in isochronous 1x clock mode
6	TX_CLK_SRC	RW	1'h0	Transmitter clock source selector 0: transmitter clock source is the output of the baud rate generator 1: transmitter uses external clock applied to the RI pin
5:4	TX_CLK_GEN	RW	2'h0	Transmitter 1x clock or baud rate generator output (BAUD_OUT) on the DTR pin. 00: The function of the DTR pin is defined by the setting of ACR[4:3]. 01: The transmitter 1x clock is asserted on the DTR pin and setting of ACR[4:3] is ignored. 10: The output of baud rate generator (Nx clock) is asserted on the DTR pin and the setting of ACR[4:3] is ignored. 11: Reserved
3	RX_CLK_MD	RW	1'h0	Receiver 1x clock mode selector 0: Receiver clock is in Nx clock mode 1: Receiver is in isochronous 1x clock mode
2	BAUD_OUT	RW	1'h0	Disable BAUD_OUT pin 0: BAUD_OUT is enabled and connected to the baud rate generator which is Nx clock. By default it is the 16x clock but using the TCR register it may be configured in range from 4x to 16x clock. 1: BAUD_OUT is disabled and permanently set to logic 0
1:0	RX_CLK_SRC	RW	2'h0	Receiver Clock source selector 00: The RCLK pin is selected for the receiver clock 01: The DSR pin is selected for the receiver clock

				10: The baud rate generator output is selected for the receiver clock (internal BAUD_OUT connection) 11: The transmitter clock is selected for the receiver clock
--	--	--	--	--

**Table 13.32 - UART\_CKS Clock Select Register**

#### 13.6.5 UART\_TTL - Transmitter Trigger Level Register (SPR offset: 0x04)

This register is located at 0x04 offset of the Indexed Control Register. This register is used for storing the interrupt trigger level for the transmitter in 950 mode (ACR[5] = 1). The interrupt occurs (if enabled) when the transmitter FIFO level falls below the value of the TTL register. If the TTL=0, then an interrupt will occur when both FIFO and shift register are empty, and the SO line is marked to be in the idle state.

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	TRIG_LVL	RW	7'h0	Transmitter Trigger Level The interrupt trigger level for the transmitter in 950 mode (ACR[5] = 1)

**Table 13.33 - UART\_TTL - Transmitter Trigger Level Register**

#### 13.6.6 UART\_RTL - Receiver Trigger Level Register (SPR offset: 0x05)

The RTL register is located at 0x05 offset of the ICR. This register is used for storing the interrupt trigger level for the receiver in 950 mode (ACR[5] = 1). The interrupt occurs (if enabled) when the receiver FIFO level reaches the value stored in this register.

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	TRIG_LVL	RW	7'h0	Receiver Trigger Level The interrupt trigger level for the receiver in 950 mode (ACR[5] = 1)

**Table 13.34 - UART\_RTL - Receiver Trigger Level Register**

#### 13.6.7 UART\_FCL - Flow Control Level LSB Register (SPR offset: 0x06)

Automatic flow control is supported by FCL and FCH registers. These registers are active only in Enhanced mode, when FCR[6:7] bits are disabled (ACR[5] = 1). The FCL stores the lower trigger level and FCH stores the upper trigger level. Both registers are able to store level values from 0 to 127.

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	FLW_CNTL	RW	7'h0	Value of Flow Control LSB

**Table 13.35 - UART\_FCL - Flow Control Level LSB Register**

#### 13.6.8 UART\_FCH - Flow Control Level Register MSB (SPR offset: 0x07)

Automatic flow control is supported by FCL and FCH registers. These registers are active only in Enhanced mode, when FCR[6:7] bits are disabled (ACR[5] = 1). The FCL stores the lower trigger

level and FCH stores the upper trigger level. Both registers are able to store level values from 0 to 127.

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	FLW_CNTL	RW	7'h0	Value of Flow Control MSB

**Table 13.36 - UART\_FCH - Flow Control Level Register MSB**

### 13.6.9 UART\_ID1 - Identification 1 Register (SPR offset: 0x08)

To identify the device type, use ID1, ID2, ID3 and REV registers. In ID1, ID2 and ID3 registers, a hexadecimal ID of the device is written. The REV register includes a hardware revision sign.

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h0	Identification value 1

**Table 13.37 - UART\_ID1 - Identification 1 Register**

### 13.6.10 UART\_ID2 - Identification 2 Register (SPR offset: 0x09)

To identify the device type, use ID1, ID2, ID3 and REV registers. In ID1, ID2 and ID3 registers, a hexadecimal ID of the device is written.

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h0	Identification value 2

**Table 13.38 - UART\_ID2 - Identification 2 Register**

### 13.6.11 UART\_ID3 - Identification 3 Register (SPR offset: 0x0A)

To identify the device type, use ID1, ID2, ID3 and REV registers. In ID1, ID2 and ID3 registers, a hexadecimal ID of the device is written.

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h0	Identification value 3

**Table 13.39 - UART\_ID3 - Identification 3 Register**

### 13.6.12 UART\_REV - Revision Register (SPR offset: 0x0B)

To identify the device type, use ID1, ID2, ID3 and REV registers. In ID1, ID2 and ID3 registers, a hexadecimal ID of the device is written.

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h0	hardware revision sign

**Table 13.40 - UART\_REV - Revision Register**

### 13.6.13 UART\_CSR - Channel Software Reset Register (SPR offset: 0x0C)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h0	00: To reset the UART, write 0x00 to the Channel Software Reset register

**Table 13.41 - UART\_CSR - Channel Software Reset Register**

### 13.6.14 UART\_NMR - Nine Bit Mode Register (SPR offset: 0x0D)

To enable 9-bit data mode NMR[0] bit must be logic 0. In this mode data are nine bits wide, and the 9-th bit is stored in LSR[2] for receiving. In transmission the 9-th bit should be written in SPR[0] bit before writing 8-bit data to THR.

In 9-bit mode the setting in LCR[1:0] are ignored. Furthermore as parity is permanently disabled, the setting of LCR[5:3] is also ignored.

In 9-bit mode, in-band flow control is disabled.

When the UART is configured for both Enhanced and 9-bit data mode, setting IER[5] will enable detection of up to four 'address' characters. The eight least significant bits of these characters are stored in XON1, XON2, XOFF1 and XOFF2 registers. The 9-th bit of these characters is stored in NMR[5] to NMR[2].

Bit	Name	Type	Default Value	Description
7:6	Reserved	-	-	-
5	9_SC4	RW	1'h0	9-th bit of special characters
4	9_SC3	RW	1'h0	9-th bit of special characters
3	9_SC2	RW	1'h0	9-th bit of special characters
2	9_SC1	RW	1'h0	9-th bit of special characters
1	9_INT_EN	RW	1'h0	9-bit data mode interrupt enable 0: interrupt for detection of an 'address' character is disabled 1: interrupt for detection of an 'address' character is enabled
0	9_EN	RW	1'h0	9-bit data mode enable

**Table 13.42 - UART\_NMR - Nine Bit Mode Register**

### 13.6.15 UART\_MDM - Modem Disable Mask Register (SPR offset: 0x0E)

MDM is used to mask selected interrupts of modem lines.

Bit	Name	Type	Default Value	Description
7:4	Reserved	-	-	-
3	DCD_MASK	RW	1'h0	Delta DCD disable. 0: Enables level 4 interrupt from delta DCD when IER[3]=1 1: Disables level 4 interrupt from delta DCD.
2	RI_MASK	RW	1'h0	Trailing edge RI disable. 0: Enables level 4 interrupt from trailing edge RI when IER[3]=1 1: Disables level 4 interrupt from trailing edge RI.
1	DSR_MASK	RW	1'h0	Delta DSR disable. 0: Enables level 4 interrupt from delta DSR

Bit	Name	Type	Default Value	Description
				when IER[3]=1 1: Disables level 4 interrupt from delta DSR.
0	CTS_MASK	RW	1'h0	Delta CTS disable. 0: Enables level 4 interrupt from delta CTS when IER[3]=1 1: Disables level 4 interrupt from delta CTS.

**Table 13.43 - UART\_MDM - Modem Disable Mask Register**

#### 13.6.16 UART\_RFC - Readable FCR Register (SPR offset: 0x0F)

Bit	Name	Type	Default Value	Description
7:0	FCR	RO	8'h00	Read the state of FCR register

**Table 13.44 - UART\_RFC - Readable FCR Register**

#### 13.6.17 UART\_GDS - Good Data Status Register (SPR offset: 0x10)

Good data status is set when the following conditions are true:

- ISR reads level 0 (no interrupt), level 2 or 2a (receiver data) or level 3 (THR empty) interrupt.
- LSR[7] is clear.
- LSR[1] is clear.

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	Contains 'good data status' bit on least significant position.

**Table 13.45 - UART\_GDS - Good Data Status Register**

#### 13.6.18 UART\_RSRV\_1 - Reserved 1 Register (SPR offset: 0x11)

Bit	Name	Type	Default Value	Description
7:0	Reserved	-	-	-

**Table 13.46 - UART\_RSRV\_1 - Reserved 1 Register**

#### 13.6.19 UART\_PIDX - Port Index Register (SPR offset: 0x12)

Bit	Name	Type	Default Value	Description
7:0	DATA	RO	8'h00	The value of UART index is 0.

**Table 13.47 - UART\_PIDX - Port Index Register**

#### 13.6.20 UART\_CKA - Clock Alteration Register (SPR offset: 0x13)

Bit	Name	Type	Default Value	Description
7:5	Reserved	-	-	-
4	CLK_TXRDY	RW	1'h0	Output system clock on TxRdy pin
3	CLK_SEL	RW	1'h0	Use CLKSEL pin for system clock
2	INV_DTR	RW	1'h0	Invert DTR signal
1	INV_TX_CLK	RW	1'h0	Invert internal Tx clock
0	INV_RX_CLK	RW	1'h0	Invert internal Rx clock

**Table 13.48 - UART\_CKA - Clock Alteration Register**

## 14 Timers and Watchdog

FT900 consists of a 32-bit watchdog timer and four 16-bit users' timers.

The watchdog timer is clocked off the main clock. The watchdog can be initialized with a 5-bit register. The value of this register points to a bit of the 32-bit counter which will be set. A timer decrements and signals an interrupt when it rolls over. Once started and initialized the watchdog cannot be stopped. It can be cleared by writing into a register.

Four user timers can be clocked off the main clock or a common 16-bit prescaler, which can be selected for each timer individually. These timers can be started, stopped and cleared-initialized. Current values of all four user timers can be read from registers (one at a time - common register, multiplexed access). All timers count up or down and signal an interrupt when rolling over. Each of the timers can be configured to be one-shot or in continuous mode. They are initialized from a common register and only one at a time (multiplexed access).

The Prescaler block is a 16-bit timer/counter. It can be cleared-initialized by writing into a register the same as with other timers, however if one of the user timers has already started using the prescaler it cannot be cleared, and the command is ignored. The Prescaler automatically stops after clear. It also starts automatically when any of the user timers using it starts.

All timers (4 user timers, prescaler and watchdog) instantiate the same block. Setting clear input high, depending on the direction input value, initializes the timer with a final value if counting up or 0 when counting down. Start input triggers a timer which increments/decrements synchronously with an enable signal. Setting mode input high causes, a timer to stop when it rolls over.

Normal operation:

User timers	Prescaler	Watchdog
Select the timer to initialize by writing into the <b>TIMER_SELECT</b> register. Write initial/final value into <b>TIMER_WRITE_LS</b> and <b>TIMER_WRITE_MS</b> registers.	Write initial value into <b>TIMER_PRESC_LS</b> and <b>TIMER_PRESC_MS</b> registers.	Write initial value into <b>TIMER_WDG</b> register to initialize one of the 32 bits of the timer.
Write into <b>direction</b> bit in <b>TIMER_CONTROL_3</b> register to select up/down counting.	N/A	N/A
Write into <b>mode</b> bit in <b>TIMER_CONTROL_3</b> register to select mode.	N/A	N/A
Write into <b>clear_x</b> bits in <b>TIMER_CONTROL_4</b> register to initialize the timer.	Write into <b>clear_presc</b> bit in <b>TIMER_CONTROL_4</b> register to initialize the prescaler (if possible)	Write into <b>clear_wdg</b> bit in <b>TIMER_CONTROL_2</b> register to clear watchdog.
Write into <b>start_x</b> bits in <b>TIMER_CONTROL_1</b> register to start the timer.	Write into <b>prescaler_en</b> bit in <b>TIMER_CONTROL_2</b> register to enable prescaler and it will automatically start when the timer/timers using it starts.	Write into <b>start_wdg</b> bit in <b>TIMER_CONTROL_2</b> register to start watchdog.
Select timer you want to read from by writing into <b>timer_read_sel</b> bit in <b>TIMER_SELECT</b> register.	N/A	N/A

Current value can be read from <b>TIMER_READ_LS</b> and <b>TIMER_READ_MS</b> registers.		
Write into <b>stop_x</b> bit in <b>TIMER_CONTROL_1</b> register to stop the timer.	N/A	N/A

**Table 14.1 - Timers/Watchdog Operation**

## 14.1 Register Summary

Listed below are the registers with their offset from the base address (0x10340). All registers can only be accessed via Byte (8-bit) mode.

Offset	Register	Default Value	References
<b>0x00</b>	TIMER_CONTROL_0 - Timers Control Register 0	0x00	<a href="#">Section 14.2.1</a>
<b>0x01</b>	TIMER_CONTROL_1 - Timers Control Register 1	0x00	<a href="#">Section 14.2.2</a>

**Table 14.2 - Overview of Timers/Watchdog Registers**

## 14.2 Register Details

### 14.2.1 TIMER\_CONTROL\_0 - Timers Control Register 0 (address offset: 0x00)

Bit	Name	Type	Default Value	Description
1	block_en	RW	1'b0	1: To enable the timer module
0	soft_reset	RWAC	1'b0	1: Write 1 to trigger the reset

**Table 14.3 - TIMER\_CONTROL\_0 - Timers Control Register 0**

#### 14.2.2 TIMER\_CONTROL\_1 - Timers Control Register 1 (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	stop_d	RWAC	1'b0	1: To trigger stopping timer D
6	stop_c	RWAC	1'b0	1: To trigger stopping timer C
5	stop_b	RWAC	1'b0	1: To trigger stopping timer B
4	stop_a	RWAC	1'b0	1: To trigger stopping timer A
3	start_d	RWAC	1'b0	1: To trigger starting timer D
2	start_c	RWAC	1'b0	1: To trigger starting timer C
1	start_b	RWAC	1'b0	1: To trigger starting timer B
0	start_a	RWAC	1'b0	1: To trigger starting timer A

**Table 14.4 - TIMER\_CONTROL\_1 - Timers Control Register 1**

#### 14.2.3 TIMER\_CONTROL\_2 - Timers Control Register 2 (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:4	prescaler_en	RW	4'h0	Enable prescaler bits for timer's D/C/B/A respectively
3	wdg_int_ien	RW	1'b0	1: enable watch dog interrupt
2	wdg_int	RW1C	1'b0	1: watch-dog interrupt pending
1	clear_wdg	RWAC	1'b0	1: To trigger clearing watch dog timer
0	start_wdg	RWAC	1'b0	1: To trigger starting watch dog timer

**Table 14.5 - TIMER\_CONTROL\_2 - Timers Control Register 2**

#### 14.2.4 TIMER\_CONTROL\_3 - Timers Control Register 3 (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7:4	direction	RW	4'h0	Counter direction bits for timer's D/C/B/A respectively 1: Up 0: Down
3:0	mode	RW	4'h0	Continuous/1-shot mode bits for timer's D/C/B/A respectively 1: 1-shot 0: Continuous

**Table 14.6 - TIMER\_CONTROL\_3 - Timers Control Register 3**

#### 14.2.5 TIMER\_CONTROL\_4 - Timers Control Register 4 (address offset: 0x04)

Bit	Name	Type	Default Value	Description
4	presc_clear	RWAC	1'b0	1: To trigger clearing prescaler
3	clear_d	RWAC	1'b0	1: To trigger clearing timer D
2	clear_c	RWAC	1'b0	1: To trigger clearing timer C
1	clear_b	RWAC	1'b0	1: To trigger clearing timer B
0	clear_a	RWAC	1'b0	1: To trigger clearing timer A

**Table 14.7 - TIMER\_CONTROL\_4 - Timers Control Register 4**

#### 14.2.6 TIMER\_INT - Timers Interrupt Register (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7	timer_int_d_en	RW	1'b0	1: Enable timer D interrupt
6	timer_int_d	RW1C	1'b0	1: Timer D interrupt pending
5	timer_int_c_en	RW	1'b0	1: Enable timer C interrupt
4	timer_int_c	RW1C	1'b0	1: Timer C interrupt pending
3	timer_int_b_en	RW	1'b0	1: Enable timer B interrupt
2	timer_int_b	RW1C	1'b0	1: Timer B interrupt pending
1	timer_int_a_en	RW	1'b0	1: Enable timer A interrupt
0	timer_int_a	RW1C	1'b0	1: Timer A interrupt pending

**Table 14.8 - TIMER\_INT - Timers Interrupt Register**

#### 14.2.7 TIMER\_SELECT - Timers A..D Select Register (address offset: 0x06)

Bit	Name	Type	Default Value	Description
3:2	timer_read_sel	RW	2'h0	Select one of Timers A/B/C/D to read (value 0/1/2/3)
1:0	timer_write_sel	RW	2'h0	Select one of Timers A/B/C/D to write (value 0/1/2/3)

**Table 14.9 - TIMER\_SELECT - Timers A..D Select Register**

#### 14.2.8 TIMER\_WDG - Watchdog Start Value (address offset: 0x07)

Bit	Name	Type	Default Value	Description
4:0	timer_wdg_write	RW	5'h00	Setting watchdog value
			5'h00	32'h0000_0001
			5'h01	32'h0000_0002
			...	...
			5'h1E	32'h4000_0000
			5'h1F	32'h8000_0000

**Table 14.10 - TIMER\_WDG - Watchdog Start Value**

**14.2.9 TIMER\_WRITE\_LS - Timer A..D Start Value 7:0 (address offset: 0x08)**

Bit	Name	Type	Default Value	Description
7:0	timer_write_7_0	RW	8'h00	Write low byte of the timer start value

**Table 14.11 - TIMER\_WRITE\_LS - Timer A..D Start Value 7:0**
**14.2.10 TIMER\_WRITE\_MS - Timer A..D Start Value 15:8 (address offset: 0x09)**

Bit	Name	Type	Default Value	Description
7:0	timer_write_15_8	RW	8'h00	Write high byte of the timer start value

**Table 14.12 - TIMER\_WRITE\_MS - Timer A..D Start Value 15:8**
**14.2.11 TIMER\_PRESC\_LS - Prescaler Start Value 7:0 (address offset: 0x0A)**

Bit	Name	Type	Default Value	Description
7:0	timer_presc_7_0	RW	8'h00	Write low byte of the timer prescaler start value

**Table 14.13 - TIMER\_PRESC\_LS - Prescaler Start Value 7:0**
**14.2.12 TIMER\_PRESC\_MS - Prescaler Start Value 15:8 (address offset: 0x0B)**

Bit	Name	Type	Default Value	Description
7:0	timer_presc_15_8	RW	8'h00	Write high byte of the timer prescaler start value

**Table 14.14 - TIMER\_PRESC\_MS - Prescaler Start Value 15:8**
**14.2.13 TIMER\_READ\_LS - Timer A..D Current Value 7:0 (address offset: 0x0C)**

Bit	Name	Type	Default Value	Description
7:0	timer_read_7_0	RO	8'h00	Read low byte of the timer start value

**Table 14.15 - TIMER\_READ\_LS - Timer A..D Current Value 7:0**
**14.2.14 TIMER\_READ\_MS - Timer A..D Current Value 15:8 (address offset: 0x0D)**

Bit	Name	Type	Default Value	Description
7:0	timer_read_15_8	RO	8'h00	Read high byte of the timer start value

**Table 14.16 - TIMER\_READ\_MS - Timer A..D Current Value 15:8**

## 15 I2S

The I2S interface supports both Master and Slave modes. The formats supported are I2S, Left Justified and Right Justified.

In the Master mode, 2 clock sources are to be provided externally. One is 24.576MHz and the other 22.5792MHz. LRCLK, BCLK and MCLK will be generated by the module based on the sampling rate and bit length.

The table below shows the oversampling rate supported (i.e. the MCLK frequency supported). The MCLK divider factor must be set accordingly. The reference clock is either the 24.576MHz or 22.5792MHz incoming clock.

Sampling frequency	Oversampling Rate Supported	Reference Clock	MCLK Divider Setting
11025	32fs	22.5792MHz	64
	64fs		32
	128fs		16
	256fs		8
22050	32fs	22.5792MHz	32
	64fs		16
	128fs		8
	256fs		4
44100	32fs	22.5792MHz	16
	64fs		8
	128fs		4
	256fs		2
16000	32fs	24.576MHz	48
	64fs		24
	128fs		12
	256fs		6
	384fs		4
	512fs		3
32000	32fs	24.576MHz	24
	64fs		12
	128fs		6
	256fs		3
	384fs		2
48000	32fs	24.576MHz	16
	64fs		8
	128fs		4
	256fs		2
	512fs		1
96000	32fs	24.576MHz	8

Sampling frequency	Oversampling Rate Supported	Reference Clock	MCLK Divider Setting
192000	64fs	24.576MHz	4
	128fs		2
	256fs		1
192000	32fs	24.576MHz	4
	64fs		2
	128fs		1

**Table 15.1 - Oversampling rates supported by FT900 I2S**

In this mode (i.e., Master mode), the number of BCLK cycles per channel per sampling cycle can only be either 16 or 32.

The table shows the supported bit length with the number of BCLK per sampling cycle in the Master mode. The BCLK divider factor must be set accordingly. The reference clock is either the 24.576MHz or 22.5792MHz incoming clock.

Sampling Frequency	Bit length / Channel	# of BCLK cycles / Channel / Sampling Cycle	BCLK Divider Setting
11025	16	16	64
	16, 20, 24, 32	32	32
22050	16	16	32
	16, 20, 24, 32	32	16
44100	16	16	16
	16, 20, 24, 32	32	8
16000	16	16	48
	16, 20, 24, 32	32	24
32000	16	16	24
	16, 20, 24, 32	32	12
48000	16	16	16
	16, 20, 24, 32	32	8
96000	16	16	8
	16, 20, 24, 32	32	4
192000	16	16	4
	16, 20, 24, 32	32	2

**Table 15.2 - FT900 I2S settings**

In the Slave mode, LRCLK and BCLK are to be input to the device. MCLK is not used in this case; neither are the 24.576MHz and 22.5792MHz inputs. They can be configured as GPIOs.

In the Slave mode, the incoming/outgoing data can be 16, 20, 24 or 32 bits per channel. And the incoming number of BCLK cycles per sampling period can be 16, 20, 24 or 32. The data length can be X-bit per channel whereas the number of BCLK cycles per sampling period can be any setting mentioned that is larger or equal to X-bit. For example, 16-bit data length per channel can be supported with any of 16, 20, 24 or 32 BCLK cycles per sampling period setting. **However, the**

**maximum frequency of BCLK is 12.288MHz regardless of the sampling frequency and bit length.**

## 15.1 Register Summary

Listed below are the registers with their offset from the base address (0x10350). All registers can only be accessed via Word (16-bit) mode.

Offset	Register	Default Value	References

## 15.2 Register Details

### 15.2.1 I2SCR - Configuration Register 1 (address offset: 0x00)

Bit	Name	Type	Default Value	Description
15	Soft Reset	RW	1'b0	1: To turn on the soft reset. 0: To turn off the soft reset.
14:12	Padding	RW	3'h0	0: No padding required; (bit length = number of bclk cycles) 1: 4 extra 0 bits are added. 2: 8 extra 0 bits are added. 3: 12 extra 0 bits are added. 4: 16 extra 0 bits are added. Others: Reserved
11:10	Format	RW	2'h0	0: I2S Format. 1: Left Justified Format. 2: Right Justified Format. Others: Reserved
9:8	Bit Length	RW	2'h0	0: 16-bit Format. 1: 20-bit Format. 2: 24-bit Format. 3: 32-bit Format.
7	IsMaster64	RW	1'b0	This is valid for I2S Master mode only. 1: 32 BCLK cycles per channel. 0: 16 BCLK cycles per channel.
6	MasterMode	RW	1'b0	1: Set I2S to the Master Mode.
5	IsMaster22	RW	1'b0	This is valid for I2S Master mode only.

				1: Use 22.5792MHz input as the reference clock. 0: Use 24.576MHz input as the reference clock.
4	BCLK Polarity	RW	1'b0	1: Invert the polarity of BCLK.
3	LRCLK Out Polarity	RW	1'b0	1: Invert the polarity of LRCLK for reception.
2	LRCLK In Polarity	RW	1'b0	1: Invert the polarity of LRCLK for transmission.
1	RX Enable	RW	1'b0	1: Enable the receive channel.
0	TX Enable	RW	1'b0	1: Enable the transmit channel.

**Table 15.4 - I2SCR - Configuration Register 1**
**15.2.2 I2SCR2 - Configuration Register 2 (address offset: 0x02)**

Bit	Name	Type	Default Value	Description
15:12	Reserved	-	-	-
11:8	MCLK Divider	RW	4'h0	This is valid for I2S Master mode only. 0: No division (MCLK = reference clock). 1: Divide by 2. 2: Divide by 3. 3: Divide by 4. 4: Divide by 6. 5: Divide by 8. 6: Divide by 12. 7: Divide by 16. 8: Divide by 24. 9: Divide by 32. A: Divide by 48. B: Divide by 64. Others: Reserved.
7:4	Reserved	-	-	-
3:0	BCLK Divider	RW	4'h0	This is valid for I2S Master mode only. 0: No division (MCLK = reference clock). 1: Divide by 2. 2: Divide by 3. 3: Divide by 4. 4: Divide by 6. 5: Divide by 8. 6: Divide by 12. 7: Divide by 16. 8: Divide by 24. 9: Divide by 32. **15.2.3 I2SIRQEN - Interrupt Enable Register (address offset: 0x04)**

Bit	Name	Type	Default Value	Description
15:13	Reserved	-	-	-
12	RX FIFO Ov	RW	1'b0	1: Enable Receive FIFO Overflow Interrupt.
11	RX FIFO Full	RW	1'b0	1: Enable Receive FIFO Full Interrupt.
10	RX FIFO Half	RW	1'b0	1: Enable Receive FIFO Half Full Interrupt.
9	RX FIFO Empty	RW	1'b0	1: Enable Receive FIFO Empty Interrupt.
8	RX FIFO Under	RW	1'b0	1: Enable Receive FIFO Underflow Interrupt.
7:5	Reserved	-	-	-
4	TX FIFO Ov	RW	1'b0	1: Enable Transmit FIFO Overflow Interrupt.
3	TX FIFO Full	RW	1'b0	1: Enable Transmit FIFO Full Interrupt.
2	TX FIFO Half	RW	1'b0	1: Enable Transmit FIFO Half Full Interrupt.
1	TX FIFO Empty	RW	1'b0	1: Enable Transmit FIFO Empty Interrupt.
0	TX FIFO Under	RW	1'b0	1: Enable Transmit FIFO Underflow Interrupt.

**Table 15.6 - I2SIRQEN - Interrupt Enable Register**
**15.2.4 I2SIRQPEND - Interrupt Pending Register (address offset: 0x06)**

Bit	Name	Type	Default Value	Description
15:13	Reserved	-	-	-
12	RX FIFO Ov	RW1C	1'b0	1: Receive FIFO Overflow Interrupt Pending. Write 1 to clear.
11	RX FIFO Full	RW1C	1'b0	1: Receive FIFO Full Interrupt Pending. Write 1 to clear.
10	RX FIFO Half	RW1C	1'b0	1: Receive FIFO Half Full Interrupt Pending. Write 1 to clear.
9	RX FIFO Empty	RW1C	1'b0	1: Receive FIFO Empty Interrupt Pending. Write 1 to clear.
8	RX FIFO Under	RW1C	1'b0	1: Receive FIFO Underflow Interrupt Pending. Write 1 to clear.
7:5	Reserved	-	-	-
4	TX FIFO Ov	RW1C	1'b0	1: Transmit FIFO Overflow Interrupt Pending. Write 1 to clear.
3	TX FIFO Full	RW1C	1'b0	1: Transmit FIFO Full Interrupt Pending. Write 1 to clear.
2	TX FIFO Half	RW1C	1'b0	1: Transmit FIFO Half Full Interrupt Pending. Write 1 to clear.
1	TX FIFO Empty	RW1C	1'b0	1: Transmit FIFO Empty Interrupt Pending.

				Write 1 to clear.
0	TX FIFO Under	RW1C	1'b0	1: Transmit FIFO Underflow Interrupt Pending. Write 1 to clear.

**Table 15.7 - I2SIRQPEND - Interrupt Pending Register**

**15.2.5 I2SRWDATA - Transmit / Receive Data Register (address offset: 0x08)**

Bit	Name	Type	Default Value	Description
15:0	TX FIFO Data	WO	-	Data window for writing data to the transmit FIFO.
15:0	RX FIFO Data	RO	16'h0000	Data window for reading data from the receive FIFO.

**Table 15.8 - I2SRWDATA - Transmit / Receive Data Register**

**15.2.6 I2SRXCOUNT - RX Count Register (address offset: 0x0C)**

Bit	Name	Type	Default Value	Description
15:0	RX FIFO Data Count	RO	16'h0000	Indicates the amount of data in the Receive FIFO.

**Table 15.9 - I2SRXCOUNT - RX Count Register**

**15.2.7 I2STXCOUNT - TX Count Register (address offset: 0x0E)**

Bit	Name	Type	Default Value	Description
15:0	TX FIFO Data Count	RO	16'h0000	Indicates the amount of data in the Transmit FIFO.

**Table 15.10 - I2STXCOUNT - TX Count Register**

## 16 SPI Master

There is a SPI Master module in the device.

Listed below are the key features of this SPI master:

- Full duplex synchronous serial data transfer
- Single, Dual and Quad SPI transfer
- Master operation
- Multimaster system supported
- Two modes of operations: SPI mode and FIFO mode
- FIFO size of 64 bytes
- Support up to 8 SPI slaves
- System error detection
- Interrupt generation
- Bit rates generated 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512 of system clock
- Four transfer formats supported

### 16.1 Register Summary

Listed below are the registers with their offset from the base address (0x102A0). All registers can only be accessed via Double-Word (32-bit) mode. However, the least significant byte of the FIFO can be accessed via Byte (8-bit) mode. This facilitates fast byte-oriented operations.

**Table 16.2 - SPIM\_CNTL – Control Register**

### 16.2.2 SPIM\_STATUS – Status Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7	SPI_FLAG	RW	1'b0	Interrupt request; this flag is automatically set to one at the end of an SPI transfer.
6	WR_COL	RW	1'b0	Write collision error status flag. The flag is automatically set if the SPDR is written when the TX register is full (in FIFO Mode when the TX FIFO is full).
5	SPI_BIS	RW	1'b0	Indicates end of transmission from SPIM_ALT_DATA register. This flag can generate an interrupt if enabled by SPIM_TNSFR_FRMT_CNTL[6]=1
4	MOD_FAULT	RW	1'b0	SPI mode-fault error status flag. This flag is set if the SS pin goes to active low.

Bit	Name	Type	Default Value	Description
3	THRE	RW	1'b0	SPI in IDLE state with TX FIFO or THR register empty 0: Transmission is in progress
2	TX_EMPTY	RW	1'b0	Transmitter Empty 0: TX FIFO contains at least one byte. 1: TX FIFO is empty
1	RX_FIFOFULL	RW	1'b0	Receiver FIFO Full
0	SSC_EN	RW	1'b0	Slave Select Control Enable 1: auto SS assertions enabled 0: auto SS assertions disabled – SS always shows contents of Slave Select Control Register.

**Table 16.3 - SPIM\_STATUS – Status Register**

#### 16.2.3 SPIM\_DATA – Receiver and Transmitter Data Registers (address offset: 0x08)

Bit	Name	Type	Default Value	Description
7:0	SPDR_RX	RO	8'h00	Data from last Receive operation
7:0	SPDR_TX	WO	8'h00	Data for next Transmit operation

**Table 16.4 - SPIM\_DATA – Receiver and Transmitter Data Registers**

#### 16.2.4 SPIM\_SLV\_SEL\_CNTL – Slave Select Control Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'hFF	SS7-SS0 pin select 0: assigned SS while Master transfer is active 1: SS is forced to logic 1

**Table 16.5 - SPIM\_SLV\_SEL\_CNTL – Slave Select Control Register**

#### 16.2.5 SPIM\_FIFO\_CNTL – FIFO Control Register (address offset: 0x10)

Bit	Name	Type	Default Value	Description
7:6	RCVR_TRIG	RW	2'h0	RCVR FIFO Trigger Level
				Bits      Standard FIFO Mode (16W)*      Extended FIFO Mode (64W)*
				00      01      01
				01      04      16
				10      08      32
				11      14      56
				* Depends on SFCR[5] value
5	64_BYTE	RW	1'b0	1: 64 Byte deep FIFOs enabled
4	TIMEOUT	RW	1'b0	1: Enable Timeout interrupt
3	Reserved	-	-	-

Bit	Name	Type	Default Value	Description
2	TX_RST	RW	1'b0	Write 1 to TX FIFO and its logic; The shift register is not affected; This bit will clear itself
1	RCVR_RST	RW	1'b0	Write 1 to RX FIFO and its logic; The shift register is not affected; This bit will clear itself
0	FIFO_EN	RW	1'b0	RX and TX FIFO's enable

**Table 16.6 - SPIM\_FIFO\_CNTL – FIFO Control Register**

**16.2.6 SPIM\_TNSFR\_FRMT\_CNTL – Transfer Format Control Register (address offset: 0x14)**

Bit	Name	Type	Default Value	Description
7	FIFO_EXT	RW	1'b0	1: Enable FIFO extension and allow 16 bits data transfer to / from FIFO
6	BISINT_EN	RW	1'b0	1: Enable interrupt generation after the transfer is complete from SPIM_ALT_DATA register
5	MULTI_REC	RW	1'b0	1: Allow continuous reception of data without the necessity of loading the TX FIFO
4	Reserved	-	-	-
3	TX_IEN	RW	1'b0	1: Transmitter FIFO Empty interrupt enabled
2	DIR	RW	1'b0	1: Performs multichannel READ (Requires DUAL / QUAD mode to be enabled)
1	QUAD_SPI	RW	1'b0	1: Enable QUAD SPI transfer
0	DUAL_SPI	RW	1'b0	0: Enable DUAL SPI transfer

**Table 16.7 - SPIM\_TNSFR\_FRMT\_CNTL – Transfer Format Control Register**

**16.2.7 SPIM\_ALT\_DATA – Alternative SPI Master Data Register (address offset: 0x18)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	Alternative SPI Mode Data register. Data transmitted through this register are done as a single channel SPI only regardless of QUAD/DUAL mode setting

**Table 16.8 - SPIM\_ALT\_DATA – Alternative SPI Master Data Register**

**16.2.8 SPIM\_RX\_FIFO\_COUNT – SPI Master RX FIFO Count Register (address offset: 0x1C)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	The number of bytes available in the RX FIFO. Note that the counter can only count up to 63, then rolls back to 0. If it is 0 and SPI_FLAG bit is 1, it means there are 64 bytes in the FIFO

**Table 16.9 - SPIM\_RX\_FIFO\_COUNT – SPI Master RX FIFO Count Register**

## 17 SPI Slaves

There are two independent SPI slaves in the device.

Listed below are the key features of the SPI slaves:

- Full duplex synchronous serial data transfer
- Two modes of operations: SPI mode and FIFO mode
- FIFO size of 64 bytes
- System error detection
- Interrupt generation
- Four transfer formats supported

### 17.1 Register Summary

Listed below are the registers with their offset from the base addresses (0x102C0 and 0x102E0 respectively). All registers can only be accessed via Double-Word (32-bit) mode. However, the least significant byte of the FIFO can be accessed via Byte (8-bit) mode. This facilitates fast byte-oriented operations.

Address Offset	Register	Default Value	References

**Table 17.1 - Overview of SPI Slave Registers**

## 17.2 Register Details

### 17.2.1 SPIS\_CNTL – Control Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7	SP_IE	RW	1'b0	1: To enable SPI Slave interrupt
6	SP_E	RW	1'b0	SPI System enable; 1 to enable.
5	SP_R2	RW	1'b0	See table at SP_R1 and SP_R0
4	Reserved	-	-	-
3	CLK_POL	RW	1'b0	Clock polarity select 0: High level; SCK idles Low 1: Low level; SCK idles high
2	CLK_PHA	RW	1'b1	Clock phase 0: Shift Data Out on Falling edge; capture Data In on Rising edge 1: Shift Data Out on Rising edge; capture Data In on Falling edge
1:0	SP_R[1:0]	RW	1'b0	Set SP_R2/1/0 value to 0 if the SPI master is operating at high speed. Otherwise, set it to a non-zero value.

**Table 17.2 - SPIS\_CNTL – Control Register**

### 17.2.2 SPIS\_STATUS – Status Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7	SPI_FLAG	RW	1'b0	Interrupt request; this flag is automatically set to one at the end of an SPI transfer
6	WR_COL	RW	1'b0	Write collision error status flag. The flag is automatically set if the SPDR is written when the TX register is full (in FIFO Mode when the TX FIFO is full)
5	SPI_BIS	RW	1'b0	Indicates end of transmission from SPIS_ALT_DATA register. This flag can generate an interrupt if enabled by SPIS_TNSFR_FRMT_CNTL[6]=1
4	Reserved	-	-	-
3	THRE	RW	1'b0	SPI in IDLE state with TX FIFO or THR register empty 0: Transmission is in progress
2	TX_EMPTY	RW	1'b0	Transmitter Empty 0: TX FIFO contains at least one byte. 1: TX FIFO is empty
1	RX_FIFOFULL	RW	1'b0	Receiver FIFO Full

0	SSC_EN	RW	1'b0	Slave Select Control Enable 1: auto SS assertions enabled 0: auto SS assertions disabled – SS always shows contents of Slave Select Control Register
---	--------	----	------	--

**Table 17.3 - SPIS\_STATUS – Status Register**
**17.2.3 SPIS\_DATA – Receiver and Transmitter Data Registers (address offset: 0x08)**

Bit	Name	Type	Default Value	Description
7:0	SPDR_RX	RO	8'h00	Data from last Receive operation
7:0	SPDR_TX	WO	8'h00	Data for next Transmit operation

**Table 17.4 - SPIS\_DATA – Receiver and Transmitter Data Registers**
**17.2.4 SPIS\_SLV\_SEL\_CNTL – Slave Select Control Register (address offset: 0x0C)**

Bit	Name	Type	Default Value	Description
7:0	Reserved	-	-	-

**Table 17.5 - SPIS\_SLV\_SEL\_CNTL – Slave Select Control Register**
**17.2.5 SPIS\_FIFO\_CNTL – FIFO Control Register (address offset: 0x10)**

Bit	Name	Type	Default Value	Description
7:6	RCVR_TRIG	RW	2'h0	RCVR FIFO Trigger Level
				<b>Bits</b> Standard FIFO Mode (16W)* Extended FIFO Mode (64W)*
				00 01 01
				01 04 16
				10 08 32
				11 14 56
				* Depends on SFCR[5] value
5	64_BYTE	RW	1'b0	1: 64 Byte deep FIFOs enabled
4	TIMEOUT	RW	1'b0	1: Enable Timeout interrupt
3	Reserved	-	-	-
2	TX_RST	RW	1'b0	Write 1 to TX FIFO and its logic; The shift register is not affected; This bit will clear itself
1	RCVR_RST	RW	1'b0	Write 1 to RX FIFO and its logic; The shift register is not affected; This bit will clear itself
0	FIFO_EN	RW	1'b0	RX and TX FIFO's enable

**Table 17.6 - SPIS\_FIFO\_CNTL – FIFO Control Register**

**17.2.6 SPIS\_TNSFR\_FRMT\_CNTL – Transfer Format Control Register (address offset: 0x14)**

Bit	Name	Type	Default Value	Description
7	FIFO_EXT	RW	1'b0	1: Enable FIFO extension and allow 16 bits data transfer to / from FIFO
6	BISINT_EN	RW	1'b0	1: Enable interrupt generation after transfer is complete from SPIS_ALT_DATA register
5	MULTI_REC	RW	1'b0	1: Allow continuous reception of data without the necessity of loading the TX FIFO
4	Reserved	-	-	-
3	TX_IEN	RW	1'b0	1: Transmitter FIFO Empty interrupt enabled
2:0	Reserved	-	-	-

**Table 17.7 - SPIS\_TNSFR\_FRMT\_CNTL – Transfer Format Control Register**
**17.2.7 SPIS\_ALT\_DATA – Alternative SPI Slave Data Register (address offset: 0x18)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	Alternative SPI Mode Data register. Data transmitted through this register are done as a single channel SPI only, regardless of QUAD/DUAL mode setting.

**Table 17.8 - SPIS\_ALT\_DATA – Alternative SPI Slave Data Register**
**17.2.8 SPIS\_RX\_FIFO\_COUNT – SPI Slave RX FIFO Count Register (address offset: 0x1C)**

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	The number of bytes available in the RX FIFO. Note that the counter can only count up to 63, then rolls back to 0. If it is 0 and SPI_FLAG bit is 1, it means there are 64 bytes in the FIFO.

**Table 17.9 - SPIS\_RX\_FIFO\_COUNT – SPI Slave RX FIFO Count Register**

## 18 I2C Master

The I2C Master conforms to v2.1 and v3.0 of the I2C specification.

Listed below are the key features supported by the I2C master:

- Supports Standard Speed Mode (up to 100kb/s)
- Supports Fast mode (up to 400kb/s)
- Supports Fast-plus mode (up to 1Mb/s)
- Supports High-speed mode (up to 3.4Mb/s)
- Performs arbitration and clock synchronisation
- Supports multi-master systems
- Supports both 7-bit and 10-bit address modes
- Supports interrupt generation
- Supports FIFO mode

### 18.1 Register Summary

Listed below are the registers with their offset from the base address (0x10300). All registers can only be accessed via Byte (8-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	I2CM_SLV_ADDR - Slave Address Register	0x00	<a href="#">Section 18.2.1</a>
<b>0x01</b>	I2CM_CNTL - Control Register	0x00	<a href="#">Section 18.2.2</a>
<b>0x01</b>	I2CM_STATUS - Status Register	0x20	<a href="#">Section 18.2.3</a>
<b>0x02</b>	I2CM_DATA - Receive / Transmit Data Register	0x00	<a href="#">Section 18.2.4</a>
<b>0x03</b>	I2CM_TIME_PERIOD - Timer Period Register	0x01	<a href="#">Section 18.2.5</a>
<b>0x03</b>	I2CM_HS_TIME_PERIOD - High Speed Timer Period Register	0x01	<a href="#">Section 18.2.6</a>
<b>0x04</b>	I2CM_FIFO_LEN - FIFO Mode Byte Length	0x00	<a href="#">Section 18.2.7</a>
<b>0x05</b>	I2CM_FIFO_INT_ENABLE - FIFO Mode Interrupt Enable	0x00	<a href="#">Section 18.2.8</a>
<b>0x06</b>	I2CM_FIFO_INT_PEND - FIFO Mode Interrupt Pending	0x00	<a href="#">Section 18.2.9</a>
<b>0x07</b>	I2CM_FIFO_DATA - FIFO Data Register	0x00	<a href="#">Section 18.2.10</a>
<b>0x08</b>	I2CM_TRIG - Trigger Register	0x00	<a href="#">Section 18.2.11</a>

**Table 18.1 - Overview of I2C Master Registers**

## 18.2 Register Details

### 18.2.1 I2CM\_SLV\_ADDR – Slave Address Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7:1	SLV_ADDR	RW	7'h00	This is 7-bit address bits
0	RX_OP	RW	1'b0	0: next operation is a transmission 1: next operation is a reception

**Table 18.2 - I2CM\_SLV\_ADDR – Slave Address Register**

### 18.2.2 I2CM\_CNTL – Control Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	I2C_RST	WO	1'b0	Resets the whole I2C Master controller.
6	SLV_RST	WO	1'b0	If set together with the RUN bit, the master will generate 9 I2C clocks without generating the START condition to recover a blocking Slave device to a known state. A STOP condition will be generated. This bit will be automatically cleared.
5	ADDR	WO	1'b0	Setting this together with the RUN bit will cause the generation of a START condition and transmission of a Slave address.
4	HS	WO	1'b0	Setting this together with the RUN bit switches the Bus controller into high-speed mode.
3	ACK	WO	1'b0	This bit should normally be set when the Master is in the receiver mode to generate ACK. It must be cleared when the master requires no further data from the Slave transmitter.
2	STOP	WO	1'b0	Setting this will cause the STOP condition to be generated.
1	START	WO	1'b0	Setting this will cause the START or Repeated START condition to be generated.
0	RUN	WO	1'b0	Setting this will cause the Bus controller to be active.

**Table 18.3 - I2CM\_CNTL – Control Register**

### 18.2.3 I2CM\_STATUS – Status Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	BUS_BUSY	RO	1'b0	1: indicates the Bus is Busy, and access is not possible. It's reset by START/STOP conditions.
5	I2C_IDLE	RO	1'b1	1: indicates the Bus controller is in the IDLE state.
4	ARB_LOST	RO	1'b0	1: indicates that during the last operation the Bus controller lost the arbitration
3	DATA_ACK	RO	1'b0	1: indicates that during the last transmit operation data wasn't acknowledged.
2	ADDR_ACK	RO	1'b0	1: indicates that during the last operation the slave address wasn't acknowledged.
1	I2C_ERR	RO	1'b0	1: indicates an error occurred during the last operation – ARB_LOST, DATA_ACK or ADDR_ACK
0	I2C_BUSY	RO	1'b0	1: indicates that the Bus controller is receiving / transmitting data on the bus; other status bits of the Status register are not valid.

**Table 18.4 - I2CM\_STATUS – Status Register**

### 18.2.4 I2CM\_DATA – Receive / Transmit Data Register (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	When read, this is the data received in the last transaction. When written, this is the data to be transmitted in the next transaction.

**Table 18.5 - I2CM\_DATA – Receive / Transmit Data Register**

### 18.2.5 I2CM\_TIME\_PERIOD – Timer Period Register (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7	TIME_ENB	RW	1'b0	Cleared to use this register.
6:0	SCL_LP	RW	7'h01	Frequency scaler used in STANDARD_FAST and FAST_PLUS modes. The value is appended with a 1 at LSB to make it 8-bit. $\text{SCL\_PERIOD} = (\text{SCL\_LP}[6] * 128 + \text{SCL\_LP}[5] * 64 + \text{SCL\_LP}[4] * 32 + \text{SCL\_LP}[3] * 16 + \text{SCL\_LP}[2] * 8 + \text{SCL\_LP}[1] * 4 + \text{SCL\_LP}[0] * 2 + 1) * \text{CLK\_PERIOD}$

**Table 18.6 - I2CM\_TIME\_PERIOD – Timer Period Register**

**18.2.6 I2CM\_HS\_TIME\_PERIOD – High Speed Timer Period Register (address offset: 0x03)**

Bit	Name	Type	Default Value	Description
7	TIME_ENB	WO	1'b0	Set to use this register.
6	FAST	WO	1'b0	Set to indicate to the Bus controller to use FAST generic timing parameters.
5	Reserved	-	-	-
4:0	SCL_HP	WO	1'b1	Frequency scalar used in FAST mode. The value is appended with a 1 at the LSB and prepended with 2 0's to make it 8-bit. $\text{SCL\_PERIOD} = (\text{SCL\_HP}[4] * 32 + \text{SCL\_HP}[3] * 16 + \text{SCL\_HP}[2] * 8 + \text{SCL\_HP}[1] * 4 + \text{SCL\_HP}[0] * 2 + 1) * \text{CLK\_PERIOD}$

**Table 18.7 - I2CM\_HS\_TIME\_PERIOD – High Speed Timer Period Register**
**18.2.7 I2CM\_FIFO\_LEN – FIFO Mode Byte Length (address offset: 0x04)**

Bit	Name	Type	Default Value	Description
7:0	FIFO_BL	RW	8'h00	Number of bytes (FIFO_BL + 1) to transmit / receive when FIFO mode is enabled

**Table 18.8 - I2CM\_FIFO\_LEN – FIFO Mode Byte Length**
**18.2.8 I2CM\_FIFO\_INT\_ENABLE – FIFO Mode Interrupt Enable (address offset: 0x05)**

Bit	Name	Type	Default Value	Description
7	DONE	RW	1'b0	FIFO_BL operation completed Interrupt
6	I2C_INT	RW	1'b0	I2C Interrupt status
5	RX_FULL	RW	1'b0	RX FIFO Full interrupt enable
4	RX_HALF	RW	1'b0	RX FIFO Half Full interrupt enable
3	RX_EMPTY	RW	1'b0	RX FIFO Empty interrupt enable
2	TX_FULL	RW	1'b0	TX FIFO Full interrupt enable
1	TX_HALF	RW	1'b0	TX FIFO Half Full interrupt enable
0	TX_EMPTY	RW	1'b0	TX FIFO Empty interrupt enable

**Table 18.9 - I2CM\_FIFO\_INT\_ENABLE – FIFO Mode Interrupt Enable**

### 18.2.9 I2CM\_FIFO\_INT\_PEND – FIFO Mode Interrupt Pending (address offset: 0x06)

Bit	Name	Type	Default Value	Description
7	DONE	RW1C	1'b0	FIFO_BL operation complete interrupt pending
6	I2C_INT	RW1C	1'b0	I2C Interrupt pending
5	RX_FULL	RW1C	1'b0	RX FIFO Full interrupt pending
4	RX_HALF	RW1C	1'b0	RX FIFO Half Full interrupt pending
3	RX_EMPTY	RW1C	1'b0	RX FIFO Empty interrupt pending
2	TX_FULL	RW1C	1'b0	TX FIFO Full interrupt pending
1	TX_HALF	RW1C	1'b0	TX FIFO Half Full interrupt pending
0	TX_EMPTY	RW1C	1'b0	TX FIFO Empty interrupt pending

**Table 18.10 - I2CM\_FIFO\_INT\_PEND – FIFO Mode Interrupt Pending**

### 18.2.10 I2CM\_FIFO\_DATA - FIFO Data Register (address offset: 0x07)

Bit	Name	Type	Default Value	Description
7:0	FIFO_DATA	RW	8'h00	FIFO Data Read from RX Buffer

**Table 18.11 - I2CM\_FIFO\_DATA - FIFO Data Register**

### 18.2.11 I2CM\_TRIG - Trigger Register (address offset: 0x08)

Bit	Name	Type	Default Value	Description
7	RX_OP	RW	1'b0	A write to this register triggers the FIFO mode operation. Set this bit to 1 for RX, and 0 for TX FIFO operations. The operation will end when FIFO_BL expires.
6:0	Reserved	-	-	-

**Table 18.12 - I2CM\_TRIG - Trigger Register**

## 19 I2C Slave

The I2C Slave conforms to v2.1 and v3.0 of the I2C specification.

Listed below are the key features supported by the I2C slave:

- Supports Standard Speed Mode (up to 100kb/s)
- Supports Fast mode (up to 400kb/s)
- Supports Fast-plus mode (up to 1Mb/s)
- Supports High-speed mode (up to 3.4Mb/s)
- Performs arbitration and clock synchronisation
- Supports interrupt generation
- Supports FIFO mode
- Supports clock stretch operation

### 19.1 Register Summary

Listed below are the registers with their offset from the base address (0x10310). All registers can only be accessed via Byte (8-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	I2CS_OWN_ADDR - Own Address Register	0x00	<a href="#">Section 19.2.1</a>
<b>0x01</b>	I2CS_CNTL - Control Register	0x00	<a href="#">Section 19.2.2</a>
<b>0x01</b>	I2CS_STATUS - Status Register	0x00	<a href="#">Section 19.2.3</a>
<b>0x02</b>	I2CS_DATA - Receive / Transmit Data Register	0x00	<a href="#">Section 19.2.4</a>
<b>0x04</b>	I2CS_FIFO_LEN - FIFO Mode Byte Length	0x00	<a href="#">Section 19.2.5</a>
<b>0x05</b>	I2CS_FIFO_INT_ENABLE - FIFO Mode Interrupt Enable	0x00	<a href="#">Section 19.2.6</a>
<b>0x06</b>	I2CS_FIFO_INT_PEND - FIFO Mode Interrupt Pending	0x00	<a href="#">Section 19.2.7</a>
<b>0x07</b>	I2CS_FIFO_DATA - FIFO Data Register	0x00	<a href="#">Section 19.2.8</a>
<b>0x08</b>	I2CS_TRIG - Trigger Register	0x00	<a href="#">Section 19.2.9</a>

**Table 19.1 - Overview of I2C Master Registers**

## 19.2 Register Details

### 19.2.1 I2CS\_OWN\_ADDR – Own Address Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6:0	OWN_ADDR	RW	7'h00	This is the seven address bits of the Slave controller.

**Table 19.2 - I2CS\_OWN\_ADDR – Own Address Register**

### 19.2.2 I2CS\_CNTL – Control Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	I2C_RST	WO	1'b0	Setting this bit will reset the whole Slave controller.
6	DEV_ACTV	RW	1'b0	Device Active 1: enables the Slave controller operations 0: disables the Slave controller operations Writing a 1 sets DEV_ACTV to 1 immediately while writing 0 will not be effective immediately if there is any on-going transmission. It's suggested that this bit is polled if a 0 is written.
5:4	Reserved	-	-	-
3	REC_FIN_CLR	WO	1'b0	Writing 1 to this bit clears REC_FIN bit from the Status register.
2	SEND_FIN_CLR	WO	1'b0	Writing 1 to this bit clears SEND_FIN bit from the Status register.
1:0	Reserved	-	-	-

**Table 19.3 - I2CS\_CNTL – Control Register**

### 19.2.3 I2CS\_STATUS – Status Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	DEV_ACTV	RW	1'b0	Device Active 1: enables the Slave controller operations 0: disables the Slave controller operations Writing a 1 set DEV_ACTV to 1 immediately while writing 0 will not be effective immediately if there is any on-going transmission. It's suggested that this bit is polled if a 0 is written.
5	Reserved	-	-	-
4	BUS_ACTV	RO	1'b0	1: indicates that there is transmission: send, receive or own address detection in progress

Bit	Name	Type	Default Value	Description
3	REC_FIN	RO	1'b0	1: indicates that the Master has ended the transmit operation. It means no more RX_REQ will be set during this single or bursts receive operation. It is cleared by writing 1 to REC_FINCLR bit in the Control register.
2	SEND_FIN	RO	1'b0	1: indicates that the Master has ended the receive operation. It means no more TX_REQ will be set during this single or burst send operation. It is cleared by writing 1 to SEND_FINCLR bit in the Control register.
1	TX_REQ	RO	1'b0	1: indicates the Slave controller is addressed as transmitter and requires data from the host device.
0	RX_REQ	RO	1'b0	1: indicates the Slave controller has received data from the Master. It is automatically cleared by reading of I2CS_DATA.

**Table 19.4 - I2CS\_STATUS – Status Register**

#### 19.2.4 I2CS\_DATA – Receive / Transmit Data Register (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:0	DATA	RW	8'h00	When read, this is the data received in the last transaction. When written, this is the data to be transmitted in the next transaction.

**Table 19.5 - I2CS\_DATA – Receive / Transmit Data Register**

#### 19.2.5 I2CS\_FIFO\_LEN – FIFO Mode Byte Length (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7:0	FIFO_BL	RW	8'h00	Number of bytes (FIFO_BL + 1) to transmit / receive when FIFO mode is enabled

**Table 19.6 - I2CS\_FIFO\_LEN – FIFO Mode Byte Length**

#### 19.2.6 I2CS\_FIFO\_INT\_ENABLE – FIFO Mode Interrupt Enable (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7	DONE	RW	1'b0	FIFO_BL operation completed Interrupt
6	I2C_INT	RW	1'b0	I2C Interrupt
5	RX_FULL	RW	1'b0	RX FIFO Full interrupt enable
4	RX_HALF	RW	1'b0	RX FIFO Half Full interrupt enable
3	RX_EMPTY	RW	1'b0	RX FIFO Empty interrupt enable
2	TX_FULL	RW	1'b0	TX FIFO Full interrupt enable
1	TX_HALF	RW	1'b0	TX FIFO Half Full interrupt enable
0	TX_EMPTY	RW	1'b0	TX FIFO Empty interrupt enable

**Table 19.7 - I2CS\_FIFO\_INT\_ENABLE – FIFO Mode Interrupt Enable**

**19.2.7 I2CS\_FIFO\_INT\_PEND – FIFO Mode Interrupt Pending (address offset: 0x06)**

Bit	Name	Type	Default Value	Description
7	DONE	RW1C	1'b0	FIFO_BL operation complete interrupt pending
6	I2C_INT	RW1C	1'b0	I2C Interrupt pending
5	RX_FULL	RW1C	1'b0	RX FIFO Full interrupt pending
4	RX_HALF	RW1C	1'b0	RX FIFO Half Full interrupt pending
3	RX_EMPTY	RW1C	1'b0	RX FIFO Empty interrupt pending
2	TX_FULL	RW1C	1'b0	TX FIFO Full interrupt pending
1	TX_HALF	RW1C	1'b0	TX FIFO Half Full interrupt pending
0	TX_EMPTY	RW1C	1'b0	TX FIFO Empty interrupt pending

**Table 19.8 - I2CS\_FIFO\_INT\_PEND – FIFO Mode Interrupt Pending**
**19.2.8 I2CS\_FIFO\_DATA - FIFO Data Register (address offset: 0x07)**

Bit	Name	Type	Default Value	Description
7:0	FIFO_DATA	RO	8'h00	FIFO Data Read from the RX Buffer

**Table 19.9 - I2CS\_FIFO\_DATA - FIFO Data Register**
**19.2.9 I2CS\_TRIG - Trigger Register (address offset: 0x08)**

Bit	Name	Type	Default Value	Description
7	RX_OP	RW	1'b0	A write to this register triggers the FIFO mode operation. Set this bit to 1 for RX, and 0 for TX FIFO operations. The operation will end when FIFO_BL expires.
6:0	Reserved	-	-	-

**Table 19.10 - I2CS\_TRIG - Trigger Register**

## 20 RTC

This is a Real Time Clock (RTC) running off a dedicated 32.768 kHz oscillator. It is powered by the internal 1.2V regulator.

### 20.1 Register Summary

Listed below are the registers with their offset from the base address (0x10280). All registers can be accessed via Double-Word (32-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	RTC_CCVR - Current Counter Value Register	0x00000000	<a href="#">Section 20.2.1</a>
<b>0x04</b>	RTC_CMR - Counter Match Register	0x00000000	<a href="#">Section 20.2.2</a>
<b>0x08</b>	RTC_CLR - Counter Load Register	0x00000000	<a href="#">Section 20.2.3</a>
<b>0x0C</b>	RTC_CCR - Counter Control Register	0x00000000	<a href="#">Section 20.2.4</a>
<b>0x10</b>	RTC_STAT - Interrupt Status Register	0x00000000	<a href="#">Section 20.2.5</a>
<b>0x14</b>	RTC_RSTAT - Interrupt Raw Status Register	0x00000000	<a href="#">Section 20.2.6</a>
<b>0x18</b>	RTC_EOI - End of Interrupt Register	0x00000000	<a href="#">Section 20.2.7</a>
<b>0x1C</b>	RTC_COMP_VERSION - Component Version Register	0x3230332A	<a href="#">Section 20.2.8</a>

**Table 20.1 - Overview of RTC Registers**

### 20.2 Register Details

#### 20.2.1 RTC\_CCVR - Current Counter Value Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
31:0	DATA	RO	32'h0	This is the current value of the internal counter. This value always is read coherently.

**Table 20.2 - RTC\_CCVR - Current Counter Value Register**

#### 20.2.2 RTC\_CMR - Counter Match Register (address offset: 0x04)

Bit	Name	Type	Default Value	Description
31:0	DATA	RW	32'h0	When the internal counter matches this register, an interrupt is generated if enabled. When appropriate, this value is written coherently. Only when all relevant bytes have been written will the new value be effective.

**Table 20.3 - RTC\_CMR - Counter Match Register**

### 20.2.3 RTC\_CLR - Counter Load Register (address offset: 0x08)

Bit	Name	Type	Default Value	Description
31:0	DATA	RW	32'h0	Loaded in the counter as the loaded value, which is written coherently.

**Table 20.4 - RTC\_CLR - Counter Load Register**

### 20.2.4 RTC\_CCR - Counter Control Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
31:4	Reserved	-	-	-
3	RTC_WEN	RW	1'h0	Allows the user to force the counter to wrap when a match occurs instead of waiting until the maximum count is reached. 0: wrap disabled 1: wrap enabled
2	RTC_EN	RW	1'h0	Allows the user to control counting in the counter. 0: Counter disabled 1: Counter enabled
1	RTC_MASK	RW	1'h0	Allows the user to mask a generated interrupt. 0: Interrupt unmasked 1: Interrupt masked
0	RTC_IEN	RW	1'h0	Allows the user to disable interrupt generation. 0: Interrupt disabled 1: Interrupt enabled

**Table 20.5 - RTC\_CCR - - Counter Control Register**

### 20.2.5 RTC\_STAT - Interrupt Status Register (address offset: 0x10)

Bit	Name	Type	Default Value	Description
31:1	Reserved	-	-	-
0	RTC_STAT	RO	1'h0	This is the masked raw status 0: Interrupt is inactive 1: Interrupt is active (regardless of polarity)

**Table 20.6 - RTC\_STAT - Interrupt Status Register**

### 20.2.6 RTC\_RSTAT - Interrupt Raw Status Register (address offset: 0x14)

Bit	Name	Type	Default Value	Description
31:1	Reserved	-	-	-
0	TC_RSTA T	RO	1'h0	0: Interrupt is inactive 1: Interrupt is active (regardless of polarity)

**Table 20.7 - RTC\_RSTAT - Interrupt Raw Status Register**

**20.2.7 RTC\_EOI - End of Interrupt Register (address offset: 0x18)**

Bit	Name	Type	Default Value	Description
31:1	Reserved	-	-	-
0	RTC_EOI	RO	1'h0	By reading this location, the match interrupt is cleared. Performing read-to-clear on interrupts, the interrupt is cleared at the end of the read.

**Table 20.8 - RTC\_EOI - End of Interrupt Register**
**20.2.8 RTC\_COMP\_VERSION - Component Version Register (address offset: 0x1C)**

Bit	Name	Type	Default Value	Description
31:0	RTC_COMP_VERSION	RO	32'h3230332A	ASCII value for each number in the version, followed by *. 32_30_33_2A represents the version 2.03*.

**Table 20.9 - RTC\_COMP\_VERSION - Component Version Register**

## 21 PWM

The device supports 7 separate independent PWM channels. All channels share an 8-bit prescaler to scale the system clock frequency to the desired channels.

Each channel has its own 16-bit comparator value. This is the value that would be matched to a preset 16-bit counter. When a channel's 16-bit comparator value matches that of the 16-bit counter, the corresponding PWM channel output will toggle. This 16-bit comparator value will continue to count until it reaches its preset value, and the counter will just roll over.

A special feature allows the 7 channels each to also toggle its own output based on the comparison results of other channels. Hence each channel potentially can have up to 7 toggle edges.

The PWM can be generated as a multi-shot or continuously. When defined as a multi-shot, an interrupt may be generated at the end of the PWM production.

Channels 0 and 1 can double as a stereo 11 kHz or 22 kHz PWM audio channel. Once it's set up, the 16-bit or 8-bit PWM audio data can be downloaded to the PWM's local FIFO which can hold up to 64 stereo or 128 mono audio data. The data will be played back based on the prescaler and 16-bit counter and the data will be automatically scaled to fit the playback period if necessary.

The FIFO can generate a number of interrupts for FIFO management. They are the FIFO full, empty, half-empty, overflow and underflow. Each of these interrupts can be individually masked if required.

### 21.1 Register Summary

Listed below are the registers with their offset from the base address (0x103C0). All registers can only be accessed via Byte (8-bit) mode but the FIFO can only be accessed via Word (16-bit) mode.

Address Offset	Register	Default Value	References

**Table 21.1 - Overview of PWM Registers**

## 21.2 Register Details

### 21.2.1 PWM\_CTRL0 - PCM Control Register (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7	PWM_CH01_AUTO	RW	1'b0	Set to 1 to use channels 0 & 1 for audio playback via the internal FIFO.
6	PWM_CH01_MONO	RW	1'b0	Set to 1 for mono audio. Both channels will playback the same data.
5	PWM_CH01_8BIT	RW	1'b0	Set to 1 for 8-bit audio data.
4	PWM_CH01_SCALE	RW	1'b0	Set to 1 if automatic scaling of data is required.
3	PWM_CH01_FILTER	RW	1'b0	Set to 1 if PCM filter is required. This is valid only with PWM_CH01_AUTO and PCM_EN set.
2	PCM_EN	RW	1'b0	Set to 1 if channel 0 and channel 1 are used for PCM playback.
1	PWM_DEV_EN	RW	1'b0	Set to 1 to enable PWM. This bit is not really used.
0	PWM_SOFT_RESET	RW	1'b0	Set to 1 to reset PWM.

**Table 21.2 - PWM\_CTRL0 - PCM Control Register**

### 21.2.2 PWM\_CTRL1 - PWM Control Register (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	PCM_BYTEREVERSE	RW	1'b0	0: Data is treated as in big endian format For 8-bit, this has no effect. 1: Data is treated as in little endian format For 8-bit, this has no effect. For 16-bit, the lower and upper bytes are swapped.
5	PWM_INT	RW	1'b0	PWM Interrupt
4	PWM_INT_MASK	RW	1'b0	Interrupt mask bit for PWM_INT

2:1	PWM_TRIGGER_EN	RW	2'h0	PWM trigger enable:
				00      Disabled
				01      Positive Edge
				10      Negative Edge
				11      Any Edge
0	PWM_EN	RW	1'b0	Set to 1 to enable PWM.

**Table 21.3 - PWM\_CTRL1 - PWM Control Register**

#### 21.2.3 PWM\_PRESCALER - PWM Prescaler Register (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:0	PRESCALER	RW	8'h00	8-bit Prescaler value.

**Table 21.4 - PWM\_PRESCALER - PWM Prescaler Register**

#### 21.2.4 PWM\_CNTL - PWM Counter Register (LSB) (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7:0	CNT16_LSB	RW	8'h00	16-bit counter LSB.

**Table 21.5 - PWM\_CNTL - PWM Counter Register (LSB)**

#### 21.2.5 PWM\_CNTH - PWM Counter Register (MSB) (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7:0	CNT16_MSB	RW	8'h00	16-bit counter MSB.

**Table 21.6 - PWM\_CNTH - PWM Counter Register (MSB)**

#### 21.2.6 PWM\_CMPOL - Comparator 0 Value Register (LSB) (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7:0	CMP16_0_LSB	RW	8'h00	LSB of comparator 0 16-bit value.

**Table 21.7 - PWM\_CMPOL - Comparator 0 Value Register (LSB)**

**21.2.7 PWM\_CMP0H - Comparator 0 Value Register (MSB) (address offset: 0x06)**

Bit	Name	Type	Default Value	Description
7:0	CMP16_0_MSB	RW	8'h00	MSB of comparator 0 16-bit value.

**Table 21.8 - PWM\_CMP0H - Comparator 0 Value Register (MSB)**
**21.2.8 PWM\_CMP1L - Comparator 1 Value Register (LSB) (address offset: 0x07)**

Bit	Name	Type	Default Value	Description
7:0	CMP16_1_LSB	RW	8'h00	LSB of comparator 1 16-bit value.

**21.2.36 PWM\_SAMPLE\_FREQ\_L - PWM Data Sampling Frequency Low Byte Register  
(address offset: 0x23)**

Bit	Name	Type	Default Value	Description
7:0	PWM_SAMPLE_FREQ_L	RW	8'h22	PWM Data Sampling Frequency Low Byte

**Table 21.37 - PWM\_SAMPLE\_FREQ\_L - PWM Data Sampling Frequency Low Byte Register**

**21.2.37 PCM\_VOLUME - PCM Volume Register (address offset: 0x24)**

Bit	Name	Type	Default Value	Description	
7:5	Reserved	-	-	-	
4:0	Volume Control	RW	5'h00	0x00	Mute
				0x01	~6.25%
				0x02	~12.5%
				0x03	~19%
				0x04	~25%
				0x05	~31%
				0x06	~37%
				0x07	~44%
				0x08	~50%
				0x09	~56%
				0x0A	~63%
				0x0B	~69%
				0x0C	~75%
				0x0D	~81%
				0x0E	~88%
				0x0F	~94%
				0x10	~100%
				0x11-0x1F	Illegal; forced to 0x10

**Table 21.38 - PCM\_VOLUME - PCM Volume Register**

**21.2.38 PWM\_BUFFER - PCM Buffer Register (address offset: 0x3C)**

Bit	Name	Type	Default Value	Description
15:0	Buffer Data	WO	-	The entry point to the FIFO. It must be written in 16-bit. For 8-bit data, the upper 8-bit will be ignored.

**Table 21.39 - PWM\_BUFFER - PCM Buffer Register**

## 22 Data Capture Interface

There is an 8-bit parallel interface to collect byte streaming data from a sensor peripheral - e.g. a camera module - in a 2Kbyte internal FIFO. The interface will provide a clock to the peripheral at a speed of 25MHz (max).

### 22.1 Register Summary

Listed below are the registers with their offset from the base address (0x10360). All registers can only be accessed via Double-Word (32-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	DCAP_REG1 – Data Capture Interface Register 1	0x00000FFC	<a href="#">Section 22.2.1</a>
<b>0x04</b>	DCAP_REG2 – Data Capture Interface Register 2	0x00000000	<a href="#">Section 22.2.2</a>
<b>0x08</b>	DCAP_REG3 – Data Capture Interface Register 3	0x00000000	<a href="#">Section 22.2.3</a>
<b>0x0C</b>	DCAP_REG4 – Data Capture Interface Register 4	0x00000000	<a href="#">Section 22.2.4</a>

**Table 22.1 - Overview of Data Capture Interface Registers**

### 22.2 Register Details

#### 22.2.1 DCAP\_REG1 – Data Capture Interface Register 1 (address offset: 0x00)

Bit	Name	Type	Default Value	Description
31:16	COUNT	RW	16'h0000	Number of bytes to capture after the last trigger event. This must be in multiple of 4 bytes.
15:12	TRIG_PAT	RW	4'h0	This specifies the data capture trigger position. Data capture starts on the cycle when trigger transitions from 0 to 1.
				En[1] / VD      En[0] / HD      Trigger
				0      0      TRIG_PAT[0]
				0      1      TRIG_PAT[1]
				1      0      TRIG_PAT[2]
				1      1      TRIG_PAT[3]
11:0	THRESHOLD	RW	12'hFFC	Specifies the threshold value for the HAS_DATA signal. It must be a multiple of 4 bytes

**Table 22.2 - DCAP\_REG1 – Data Capture Interface Register 1**

### 22.2.2 DCAP\_REG2 – Data Capture Interface Register 2 (address offset: 0x04)

Bit	Name	Type	Default Value	Description
31:12	Reserved	-	-	-
11:0	FULLNESS	RO	12'h000	Specifies the number of bytes that can be safely read from the FIFO. Its value is always a multiple of 4.

**Table 22.3 - DCAP\_REG2 – Data Capture Interface Register 2**

### 22.2.3 DCAP\_REG3 – Data Capture Interface Register 3 (address offset: 0x08)

Bit	Name	Type	Default Value	Description
31:0	DATA	RO	-	Next four samples from the FIFO. Reading this will remove the sample from the FIFO. When FULLNESS is 0, the effect is non-deterministic.

**Table 22.4 - DCAP\_REG3 – Data Capture Interface Register 3**

### 22.2.4 DCAP\_REG4 – Data Capture Interface Register 4 (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
31:3	Reserved	-	-	-
2	HAS_DATA	RO	1'b0	Set when FIFO contains at least THRESHOLD bytes.
1	CLK_SENSE	RW	1'b0	1: capture data on clock rising edge
0	INT_ENB	RW	1'b0	1: enable interrupt; an interrupt will be generated when HAS_DATA = 1

**Table 22.5 - DCAP\_REG4 – Data Capture Interface Register 4**

## 23 Flash Controller

There are two ways to access the memory control unit. One is via the CPU I/O interface and the other via the one-wire debugger interface. The CPU I/O interface is described here.

From the CPU I/O interface, memory transfer can occur between the Flash and the Program Memory, and between the Flash and the Data Memory. A number of the serial Flash commands are also supported, and the CPU may issue these commands to the Flash.

As this is a shared resource between the debugger interface and CPU I/O interface, the interface must acquire the resource first before performing any of the activities. This is done by reading a test-and-set semaphore. If the interface reads a 0 from the semaphore it can safely assume it has acquired the resource. Any further read to this semaphore will return a 1 until it is released by the interface that acquired the resource.

If both the debugger and CPU attempt to acquire the resource while it is free at exactly the same time, priority is given to the debugger and the CPU interface will read a 1 instead.

Until the semaphore is acquired, the semaphore is the only register any of the interfaces can read. Once the semaphore is acquired by the interface, the interface will have full access to all the registers in the control unit.

If an interface that does not have the resource writes to the control unit registers they will be ignored while a read from any of the control unit registers will always return 0.

### 23.1 Register Summary

Listed below are the registers with their offset from the base address (0x10800). All registers can only be accessed via Byte (8-bit) mode.

Address Offset	Register	Default Value	References
<b>0x00</b>	RSADDR0 – Memory Start Address Register (LSB)	0x00	<a href="#">Section 23.2.1</a>
<b>0x01</b>	RSADDR1 – Memory Start Address Register (Byte 1)	0x00	<a href="#">Section 23.2.2</a>
<b>0x02</b>	RSADDR2 – Memory Start Address Register (MSB)	0x00	<a href="#">Section 23.2.3</a>
<b>0x03</b>	FSADDR0 – Flash Start Address Register (LSB)	0x00	<a href="#">Section 23.2.4</a>

<b>0x7E</b>	CHIPID2 – Chip ID Register (Byte 2) (only via one-wire debugger)	0xXX	<a href="#">Section 23.2.18</a>
<b>0x7F</b>	CHIPID3 – Chip ID Register (MSB) (only via one-wire debugger)	0xXX	<a href="#">Section 23.2.19</a>
<b>0x80</b>	DRWDATA – Data Register	0x00	<a href="#">Section 23.2.20</a>

**Table 23.1 - Overview of Data Capture Interface Registers**

## 23.2 Register Details

### 23.2.1 RSADDR0 – Memory Start Address Register (LSB) (address offset: 0x00)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	LSB of the start address of memory location to perform read/write for either program or data memory

**Table 23.2 - RSADDR1 – Memory Start Address Register (LSB)**

### 23.2.2 RSADDR1 – Memory Start Address Register (Byte 1) (address offset: 0x01)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	Byte 1 of the start address of memory location to perform read/write for either program or data memory

**Table 23.3 - RSADDR1 – Memory Start Address Register (Byte 1)**

### 23.2.3 RSADDR2 – Memory Start Address Register (MSB) (address offset: 0x02)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	MSB of the start address of memory location to perform read/write for either program or data memory

**Table 23.4 - RSADDR2 – Memory Start Address Register (MSB)**

**Note:** The memory start address must always be aligned to a 4-byte boundary in both read/write cases. The address is treated as a double word address (e.g., 01 is byte address 4).

### 23.2.4 FSADDR0 – Flash Start Address Register (LSB) (address offset: 0x03)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	LSB of the start address of flash location to perform read/write

**Table 23.5 - FSADDR0 – Flash Start Address Register (LSB)**

### 23.2.5 FSADDR1 – Flash Start Address Register (Byte 1) (address offset: 0x04)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	Byte 1 of the start address of flash location to perform read/write

**Table 23.6 - FSADDR1 – Flash Start Address Register (Byte 1)**

### 23.2.6 FSADDR2 – Flash Start Address Register (MSB) (address offset: 0x05)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	MSB of the start address of flash location to perform read/write

**Table 23.7 - FSADDR2 – Flash Start Address Register (MSB)**

**Note:** The flash start address must always be aligned to 256-byte boundary in the write case, and can be any value in the read case. The address is treated as a byte address (e.g., 01 is byte address 1).

### 23.2.7 BLENGTH0 – Data Byte Length Register (LSB) (address offset: 0x06)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	LSB of the Byte Length to transfer

**Table 23.8 - BLENGTH0 – Data Byte Length Register (LSB) (LSB)**

### 23.2.8 BLENGTH1 – Data Byte Length Register (Byte 1) (address offset: 0x07)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	Byte 1 of the Byte Length to transfer

**Table 23.9 - BLENGTH1 – Data Byte Length Register (Byte 1)**

### 23.2.9 BLENGTH2 – Data Byte Length Register (MSB) (address offset: 0x08)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	MSB of the Byte Length to transfer

**Table 23.10 - BLENGTH2 – Data Byte Length Register (MSB)**

**Note 1:** When the flash is the destination (write case), the byte length must be a multiple of 256 bytes (1 page of flash entry). There is no such restriction on byte length if the flash is the source (read case).

**Note 2:** The registers must be set to (byte length - 1). For example, if the byte length is 256, then BLENGTH0 is set to 255 and BLENGTH1 and BLENGTH2 are set to 0.

### 23.2.10 COMMAND – Command Register (address offset: 0x09)

Bit	Name	Type	Default Value	Description
7:0	-	WO	0x00	Command to perform. See section 23.3.

**Table 23.11 - COMMAND – Command Register**

### 23.2.11 SEMAPHORE – Semaphore Register (address offset: 0x0B)

Bit	Name	Type	Default Value	Description
7:0	-	RW	0x00	<p>Semaphore value</p> <p>If a 0 is read, then the control unit's resource is allocated to whichever that does the test. This register is then automatically set to 1.</p> <p>If a 1 is read, then the resource is being used and not free.</p> <p>This semaphore can be released by only the interface which acquires the semaphore with writing a 1 to this register.</p> <p>All other registers in this control unit are not readable or writeable until this semaphore is acquired.</p> <p>If both the CPU and Debugger test this semaphore register at the same time when it is free, priority is given to the Debugger and the CPU will read a 1 instead.</p>

**Table 23.12 - SEMAPHORE – Semaphore Register**

### 23.2.12 CONFIG – Configuration Register (address offset: 0x0C)

Bit	Name	Type	Default Value	Description
7:2	Reserved	-	-	Reserved bits
1:0	SPI_CLK	WO	2'b0	The serial SPI clock speed to the serial flash 0x0: Flash SPI clock speed = 1/2 System clock speed 0x1: Flash SPI clock speed = 1/3 System clock speed 0x2: Flash SPI clock speed = 1/4 System clock speed 0x3: Flash SPI clock speed = 1/5 System clock speed

**Table 23.13 - CONFIG – Configuration Register**

### 23.2.13 STATUS – Status Register (address offset: 0x0D)

Bit	Name	Type	Default Value	Description
7	Reserved	-	-	-
6	Control Busy	RO	1'b0	1: The control unit is busy. This means no other command should be issued. When this bit is set, bits 7, 3-0 may not be valid until this bit is cleared.
5	Data Read Ready	RO	1'b0	1: Data for read is available at data read port
4	Data Write Ready	RO	1'b0	1: Data for write can be written to data write port
3	Reserved	-	-	-
2	Reserved	-	-	-
1	Reserved	-	-	-
0	Write in Progress	RO	1'b0	1: Flash Write Operations in Progress

**Table 23.14 - STATUS – Status Register**

### 23.2.14 CRCL – Flash Content CRC Register (LSB) (address offset: 0x0E)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	LSB of the CRC16 of the flash content. The CRC is calculated upon reset when flash content is transferred to the programme memory, and the CRC is based on the polynomial X16+X15+X2+1

**Table 23.15 - CRCL – Flash Content CRC Register (LSB)**

### 23.2.15 CRCH – Flash Content CRC Register (MSB) (address offset: 0x0F)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	MSB of the CRC16 of the flash content. The CRC is calculated upon reset when flash content is transferred to the programme memory, and the CRC is based on the polynomial X16+X15+X2+1

**Table 23.16 - CRCH – Flash Content CRC Register (MSB)**

### 23.2.16 CHIPID0 – Chip ID Register (LSB) (address offset: 0x7C)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	LSB of the 32-bit chip ID, only accessible via the one-wire debugger. The same ID is available to the CPU in another register address.

**Table 23.17 - CHIPID0 – Chip ID Register (LSB)**

### 23.2.17 CHIPID1 – Chip ID Register (Byte 1) (address offset: 0x7D)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	Byte 1 of the 32-bit chip ID, only accessible via the one-wire debugger. The same ID is available to the CPU in another register address.

**Table 23.18 - CHIPID1 – Chip ID Register (Byte 1)**

### 23.2.18 CHIPID2 – Chip ID Register (Byte 2) (address offset: 0x7E)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	Byte 2 of the 32-bit chip ID, only accessible via the one-wire debugger. The same ID is available to the CPU in another register address.

**Table 23.19 - CHIPID2 – Chip ID Register (Byte 2)**

### 23.2.19 CHIPID3 – Chip ID Register (MSB) (address offset: 0x7F)

Bit	Name	Type	Default Value	Description
7:0	-	RO	0xXX	MSB of the 32-bit chip ID, only accessible via the one-wire debugger. The same ID is available to the CPU in another register address.

**Table 23.20 - CHIPID3 – Chip ID Register (MSB)**

### 23.2.20 DRWDATA – Data Register (address offset: 0x80)

Bit	Name	Type	Default Value	Description
7:0	-	RW	0x00	This is the data read or write port used to transfer data in and out of this control unit. Up to 64 addresses may be used.  When bit 4 of STATUS is not set, writing to this port will have no effect.  When bit 5 of STATUS is not set, reading this port will return 0.

**Table 23.21 - DRWDATA – Data Register**

## 23.3 Flash Controller Commands

The following commands are supported by the control unit. The command is initiated once the command register is updated. No further command can be entered until the current one is completed. If two successive commands, regardless of what they are, are entered while one is ongoing, the current operation will be aborted. The two commands will not be executed either.

The commands can be divided into 2 groups. The first group consists of commands that are supported directly by the serial flash. The second group consists of commands that initiate data transfer between the debugger/CPU interface and flash, debugger/CPU interface and program/data memory, or flash and program/data memory.

The following table lists the first group of commands. If executing any of these commands that require data input, write the required data to the DRWDATA register.

Command	Code	Description
CMDWREN	0x06	<p>The Write Enable (WREN) instruction is for setting the Write Enable Latch (WEL) bit. Those instructions such as PP, SE, BE, CE, and WRSR, which are intended to change the device content, should be set every time after the WREN instruction sets the WEL bit.</p>
CMDWRDI	0x04	<p>The Write Disable (WRDI) instruction is for resetting the Write Enable Latch (WEL) bit.</p> <p>The WEL bit is reset by the following situations:</p> <ul style="list-style-type: none"> <li>- Power-up</li> <li>- Write Disable (WRDI) instruction completion</li> <li>- Write Status Register (WRSR) instruction completion</li> <li>- Page Program (PP) instruction completion</li> <li>- Sector Erase (SE) instruction completion</li> <li>- Block Erase (BE) instruction completion</li> <li>- Chip Erase (CE) instruction completion</li> </ul>
CMDWRSR	0x01	<p>The WRSR instruction is for changing the values of Status Register Bits. Before sending WRSR instruction, the Write Enable (WREN) instruction must be executed first. The WRSR instruction can change the value of Block Protect (BP1 - bit3, BP0 - bit2) bits to define the protected area of memory (as shown in table 2). The WRSR also can set or reset the Status Register Write Disable (SRWD - bit 7) bit in accordance with Write Protection (WP#) pin signal. The WRSR instruction cannot be executed once the Hardware Protected Mode (HPM) is entered.</p> <p>This instruction has no effect on bits 6, 5, 1 and 0.</p>
CMDRDID	0x9F	<p>The RDID instruction is for reading the manufacturer ID of 1-byte and followed by Device ID of 2-byte. The MXIC Manufacturer ID and Device ID are listed as table of "ID Definitions" of the MXIC specification.</p> <p>While Program/Erase operation is in progress, it will not decode the RDID instruction, so there's no effect on the cycle of program/erase operation which is currently in progress.</p>
CMDRDSR	0x05	<p>The RDSR instruction is for reading Status Register Bits. The Read Status Register can be read at any time (even in program/erase/write status register condition) and continuously. It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.</p> <p>The status data can be read back from the STATUS register. The bits 7, 3-0 of STATUS reflect the content from this flash command.</p>

Command	Code	Description
CMDRDSFDP	0x5A	The Serial Flash Discoverable Parameter (SFDP) standard provides a consistent method of describing the functional and feature capabilities of serial flash devices in a standard set of internal parameter tables.  Refer to MXIC specification for the parameter details.
CMDSE	0x20	Sector erase; Sector address can be set at FSADDRx.
CMDBE1 / CMDBE2	0x52 / 0xD8	Block erase; Block address can be set at FSADDRx.
CMDCE1 / CMDCE2	0x60 / 0xC7	Chip erase.
CMDPP	0xB9	The Deep Power-down (DP) instruction is for setting the device on the minimizing the power consumption. During the Deep Power-down mode, the device is not active and all Write/Program/Erase instruction are ignored.
CMDRDP	0xAB	The RDP instruction is for releasing from Deep Power Down Mode.

**Table 23.22 - Flash Controller Command Group 1**

The following table lists the commands that initiate data transfer between Debugger/CPU interface and flash/program/data memory, or between flash and program/data. Each command allows the option to reset the CPU, or reboot the system, or allow the system to continue.

Command	Code	Description
CMDBG2P1	0xE0	Initiates data transfer from Debugger Interface to Program Memory.  The start address of the Program Memory destination will be dictated by RSADDRx which must be 32-bit aligned.  The number of bytes to transfer will be dictated by LENGTHx.  Data to be transferred will be in DRWDATA.
CMDBG2P2	0xE1	Similar to CMDBG2P1 except at the end of the transfer, a CPU reset will be performed.
CMDBG2P3	0xE2	Similar to CMDBG2P1 except at the end of the transfer, a system reboot will be performed.
CMDBG2D1	0xE4	Similar to CMDBG2P1 except the destination is the Data Memory.
CMDBG2D2	0xE5	Similar to CMDBG2P2 except the destination is the Data Memory.
CMDBG2D3	0xE6	Similar to CMDBG2P3 except the destination is the Data Memory.
CMDBG2F1	0xE8	Initiates data transfer from Debugger Interface to Flash Memory.  The start address of the Flash Memory destination will be dictated by FSADDRx which must be 256-byte aligned.  The number of bytes to transfer will be dictated by LENGTHx and must

Command	Code	Description
		be multiples of 256 bytes. Data to be transferred will be in DRWDATA.
CMDDBG2F2	0xE9	Similar to CMDBG2F1 except at the end of the transfer, a CPU reset will be performed.
CMDDBG2F3	0xEA	Similar to CMDBG2F1 except at the end of the transfer, a system reboot will be performed.
CMDP2F1	0xF0	Initiates data transfer from Program Memory to Flash Memory. The start address of the Program Memory destination will be dictated by RSADDRx which must be 32-bit aligned. The start address of the Flash Memory destination will be dictated by FSADDRx which must be 256-byte aligned. The number of bytes to transfer will be dictated by LENGTHx and must be multiples of 256 bytes.
CMDP2F2	0xF1	Similar to CMDP2F1 except at the end of the transfer, a CPU reset will be performed.
CMDP2F3	0xF2	Similar to CMDP2F1 except at the end of the transfer, a system reboot will be performed.
CMDF2P1	0xF4	Initiates data transfer from Flash Memory to Program Memory. The start address of the Program Memory destination will be dictated by RSADDRx which must be 32-bit aligned. The start address of the Flash Memory destination will be dictated by FSADDRx which must be 256-byte aligned. The number of bytes to transfer will be dictated by LENGTHx.
CMDF2P2	0xF5	Similar to CMDF2P1 except at the end of the transfer, a CPU reset will be performed.
CMDF2P3	0xF6	Similar to CMDF2P1 except at the end of the transfer, a system reboot will be performed.
CMDD2F1	0xF8	Initiates data transfer from Data Memory to Flash Memory. The start address of the Data Memory destination will be dictated by RSADDRx which must be 32-bit aligned. The start address of the Flash Memory destination will be dictated by FSADDRx which must be 256-byte aligned. The number of bytes to transfer will be dictated by LENGTHx and must be multiples of 256 bytes.
CMDD2F2	0xF9	Similar to CMDD2F1 except at the end of the transfer, a CPU reset will be performed.
CMDD2F3	0xFA	Similar to CMDD2F1 except at the end of the transfer, a system reboot will be performed.
CMDF2D1	0xFC	Initiates data transfer from Flash Memory to Data Memory.

Command	Code	Description
		<p>The start address of the Data Memory destination will be dictated by RSADDRx which must be 32-bit aligned.</p> <p>The start address of the Flash Memory destination will be dictated by FSADDRx which must be 256-byte aligned.</p> <p>The number of bytes to transfer will be dictated by LENGTHx.</p>
CMDF2D2	0xFD	Similar to CMDF2D1 except at the end of the transfer, a CPU reset will be performed.
CMDF2D3	0xFE	Similar to CMDF2D1 except at the end of the transfer, a system reboot will be performed.
CMDHALT	0xFF	This command forces halt immediately to the CPU. The use should be avoided as this cannot be undone. Only a system reset will remove the halt effect.

**Table 23.23 - Flash Controller Command Group 2**

## 24 Contact Information

Refer to <https://brtchip.com/contact-us/> for contact information.

### Distributor and Sales Representatives

Please visit the [Sales Network](#) page for the contact details of our distributor(s) and sales representative(s) in your country.

System and equipment manufacturers and designers are responsible to ensure that their systems, and any Bridgetek Pte Ltd (BRT Chip) devices incorporated in their systems, meet all applicable safety, regulatory and system-level performance requirements. All application-related information in this document (including application descriptions, suggested Bridgetek devices and other materials) is provided for reference only. While Bridgetek has taken care to assure it is accurate, this information is subject to customer confirmation, and Bridgetek disclaims all liability for system designs and for any applications assistance provided by Bridgetek. Use of Bridgetek devices in life support and/or safety applications is entirely at the user's risk, and the user agrees to defend, indemnify and hold harmless Bridgetek from any and all damages, claims, suits or expense resulting from such use. Document Feedback: [Send Feedback](#)

Revision	Changes	Date
1.0	Initial Release	07-11-2014
1.1	Revised Release	12-10-2015
1.2	Migrated from FTDI to Bridgetek	30-03-2017
1.3	Changed HIPID to CHIPID correcting long standing error. Corrected company address and reviewed document Updated document for FT9xx Toolchain 2.7.0 Release	29-08-2023
