1 Introduction

The VI800A-RELAY is a plug in accessory for the VM800P Plus module, which is used to develop and demonstrate the functionality of the FT800 Embedded Video Engine, EVE.

This module behaves as an SPI to relay bridge for the VM800P Plus module.

1.1 Features

- Connects to the VM800P Plus module using SPI slave interface
- SPI slave interface is converted to relay interface
- 4 Opto-isolated Inputs and 4 Relay outputs
- 8 LEDs to indicate the input and output status
- Screw connector to connect the relay inputs and relay outputs

3 Hardware Description

Please refer to section 3.3.2 for connector settings. Some VI800A-RELAY jumpers must be set to work properly with your system.

3.1 VI800A-RELAY module

The VI800A-RELAY module is intended for the plug in board to the VM800P Plus module.

The main functions of the VM800P are as follows:

- Plug in board for the VM800P plus board.
- Connect to the VM800P plus board as a SPI slave device.
- Connects to the RELAY inputs and outputs.
- Supports 4 Opto-isolated inputs (5V maximum input)
- Supports 4 relay outputs (switching 12V maximum)
- Contains 8 LEDs.
- Powered by the VM800P Plus board.

3.2 Safety Considerations

The VI800A-RELAY board is designed for 12V maximum to be switched by the relays and 5V maximum for the logic inputs. Due to the exposed electrical components and traces, and the proximity to the other circuitry of the VM800P board, the VI800A-RELAY must never carry voltages which could present a danger to users.

If the module is to be used for controlling voltages above 12V, the relays on the VI800A-RELAY may be used to switch an external circuit (e.g. a 5V or 12V coil of an external relay circuit) which has been specifically designed for safe operation at mains voltages.

The user is responsible for the safe design of any circuit connected to the VI800A-RELAY and for ensuring that this module is not exposed to any voltages outwit the ratings specified above.
3.3 Physical Descriptions

3.3.1 Dimensions

The VI800A-RELAY module dimension is illustrated in Figure 3-2 and Figure 3-3.

Figure 3-2 - VI800A-RELAY module PCB Top view

Figure 3-3 - VI800A-RELAY module PCB Bottom view
3.3.2 VI800A-RELAY Connectors

Connectors are described in the following sections.

- **CN1- SPI Interface**

  This is the interface where the SPI control and data signals are routed. There are also power and ground pins on this interface. This interface is used to connect the VI800A-RELAY board to the VM800P Plus board.

  **Note:**

  This connector should be connected to J5 of the VM800P plus board.

### 3.3.3 VI800A-RELAY Components

- **U1 – SN74AHCT595**
  This converts the MOSI signals from the VM800P Plus board to parallel output signals.

- **U2 – 74ACT14MTCX**
  This inverts the Input signals.

- **U3 and U4 – ACPL-227-500E**
  This converts the differential inputs to single ended input signals.

- **U5 – SN74HC165**
  This converts the parallel inputs to MISO signal.

- **REL1 to REL4 – IM03GR**
  This converts the parallel output to relay output signal.

- **LED1 – LED4**
  Indicates the status of the inputs.

- **LED5 – LED8**
  Indicates the status of the outputs.
4 Board Schematics

5 Hardware Setup Guide

5.1 Power Configuration

The board is powered from the VM800P Plus board. The CN1 connector on the VI800A-RELAY board should be connected to the J5 connector of the VM800P plus board as shown in Figure 5-1.

![Image](image.png)

Figure 5-1 - VI800A-RELAY module connected to VM800P Plus module

5.2 RELAY Interface connection

The relay inputs are connected to the connector CN2.
The relay outputs are connected from the connector CN3.
The LEDs LED1 to LED8 are used to display the status of the inputs and outputs.
This interface is used to add relay support to the VM800P Plus module.
